I'm not sure there's much comfort in that. Radio rights come from
politicians, and politicians respond to public pressure.

Apparently rare means he only has one.

It does not have anything to do with the number available elsewhere.

4072. FS hy-gain CD-45-II

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-02 16:53:49 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <pgU%e.124308$7f5.120900@okepread01>
Source record: 16161

I have a hy-gain CD-45-II Rotator and Control Box for sale. It is not working. I think that it is a problem in the control box. It has the original manual and the upper and lower mast brackets. The Control box looks very clean, but the needle on the meter sticks at different places when power is off and you move the box around.
I am sure that the rotator will need cleaning and lubing. These things sell for over $400 with the optional lower mast bracket. I will take $115 plus shpping for this one.
Thanks, Charlie Hugg, K5MBX

Google is talking about "wi-fi" for all of San Francisco.

There's a separate mention of an undisclosed Google stake in a startup
BPL company.

Wi-fi, as I understand it, is not BPL. I'm no expert in this stuff,
but what's your point?

This looks like WiFi on the 2.4 GHz ISM freeband, not BPL at all. Unlike
BPL, this actually might have a good chance of working reliably.

Hell they don't need all that crap to steal from the public on the utility
end.
I moved here to TN to care for my Mom terminal in bed with cancer
3 years ago.
http://personal.atl.bellsouth.net/m/e/metacalv/badbilling.html

You wouldn't believe it but they don't have to put the RATE on the
bills. So why they bother with meter reading at all. They just
charge what ever they want. So long as the TVA routes all
the power via local utility companies they don't have to
account for it to anyone.

They said there wasn't room for it but they can put lines of crap
advert's on the bill. Printing a variable is one of the first things
taught in most computer courses... Where is the rate WHAT is the rate.

Just think what a few dollars a month from all those fools amount
too. Millions!!! And no one gives a damn.

The state quickly washed their hands saying it was a municipal thing.
And the "media" won't touch it because they get their share through
"advertising" As if there were some where else to plug in or get
water from.

Any real investigative journalist looking for a story and fame?

END of soap box.... too old and busted up to pursue this myself.

Cheers Big Bro's commin

Does anyone have a diagram showing the EXACT dimensions of this pinout?

I'm making up a few of my own and have some replicas, and of course the sockets, to go by but having the precise original measurements would give me more leeway for my own drilling/measuring inaccuracies :)

TIA,
Bill

Not all ISPs set all of their newsgroups to receive or propagate or allow downloads of attachments from news posts. There was no image on my news server for either of your messages. My ISP has set an error message that says it allows binary attachements only in binary newsgroups (FYI) if I try to post a message with an attached file to a newsgroup not set to accept attached files.

Otherwise, consider placing the file in an http-accessible directory and write the URL in your post.

It is VERY, VERY rude to post binaries to discussion groups. This is
about the most offensive thing you can do on Usenet. As a result, a lot
of backbone sites (including the one upstream of me) dump all binaries
in discussion groups.

In which case, the picture should have been uploaded to the
poster's website and a link provided. Are there reeally that many ISPs
who don't provide at least a few meg for this purpose?

It's also a courtesy to those with low-speed connections who
read text-only groups. If they feel it's worth their line time to pull
the binary down using the link, they're free to do so, but not forced
to do so.

The reason that you do not HAVE binary access is that your news admin
has tailored off the binary groups because he doesn't have the disk space
to carry them.

When people start posting binaries to disucssion groups, that disk space
gets used anyway. And if it gets bad, he'll start tailoring off the groups
that are full of binaries first, if he's like me.

For some reason your original post didn't show up on my server but
these did.

It was an accident, mistake, whatever. I so seldom post pictures that
I didn't even think about what I was doing until after the fact. It
was too late to cancel when I did realize it and posted it to the
binaries.

But feel free to crucify me. That's what some people like to do on
Usenet.

Looks like a TV high voltage rectifier socket. The slots around the edge
are for the filament wires from the flyback transformer. Of course, just
because it was made for one purpose doesn't mean that it can't be used for
another. Since it has all the contacts, a power tube would work.

--
Jim Mueller wrongname@nospam.com

Well, Jim, these HV TV sockets usually dont have all the contracts! He doesnt show the bottom but often there are only 4 socket pins... which is why I pitched all mine a while back. worthless for anything but the sets they were designed for, which is the scourge of most TV parts...

It isn't a real toughie, it is a 2 pin connector with
a shield. The shield is the return for the mic and
PTT, one pin is the mike, the other is the PTT.

Which is which? I don't remember anymore, but it is
trivial to figure it out. Turn the radio on, turn
the Mic/CW gain control fully CCW, VOX off, USB, and
set the radio to high power. Using a dummy load, short
a pin to the case, and if it goes "clunk", it is the PTT.
The other one is the mic.

You're a ham, right?

-Chuck

4128. Wanted: 40m ARC-5 transmitter parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-07 12:37:22 UTC
From: k5dh@raytheon.com
Message-ID: <6_t1f.1$fH.0@dfw-service2.ext.ray.com>
Source record: 16117
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

Hi all,

I'm looking for parts to repair a T-22/ARC-5 transmitter that was damaged in shipment. This was a pristine, unused original transmitter that's worth repairing. Here's what I'm looking for:

* I need the roller coil, but only the coil itself, not all of the brackets and the roller contact. This coil is part number 6035, and must come from a 7.0 - 9.1 MHz transmitter (T-22/ARC-5, BC-459, etc).

* I need a top cover with the black wrinkle finish, which can come from any ARC-5 transmitter. It would be nice to have one from another T-22 so that the nameplate on the top would match, but that's not a necessity. I'd like to have the mirror in place over the 1629 tube, but that's also not a necessity.

* I need a front panel that's in excellent condition. I know, they're riveted to the chassis in several places. The rivets can be drilled out and replaced with either new rivets or black anodized #4-40 hardware.

* Calibration crystal somewhere in the 40m ham band. The one that came in my unit is up in the mid 8 MHz range.

I would prefer to buy just the parts I need, but if I have to, I'll buy a complete or incomplete rig if the price is cheap enuff. If you're looking to get rich by selling me ARC-5 parts, don't waste either of our time. I won't pay "eBay price" for this stuff. Someone must have what I'm looking for just taking up space in their basement...

Whatcha got?

73,
Dean K5DH

Check out Ebay and search for Greenlee. Be sure to get the radio chassis version, not the conduit which don't come in standard hole sizes. I just bought a bought an inch size for relay sockets.

sure would, but that is rare to see all the pins there... I wonder if it
was an aftermarket version where you could remove the ones you didnt need???
I worked at a parts distributor in the late 70's, sold a bunch of these, but
dont recall if there were "universal". I know we had a whole rack of
different ones... and, they were pretty dusty from not selling!

Why remove the pins you don't need? The only thing on that end of the
tube is the filament and if any of the pins are used as tie points they
better be at filament potential. The voltage is high enough to jump to
any pin that was significantly different. Since that is the case, there
should only be one pin used as a tie point, for the filament voltage
dropping resistor.

Because the unused socket elements couple electrostatically with the filiment/cathode,
and make excellent collectors of dust, launchers of corona, and generators
of squeal in the audio. Besides, there isn't all that much extra power
available in the HV circuit, you want to squelch as many leakage paths
as possible.

This is all very interesting, but does anyone want it?

BTW, no one mentioned the threads. I assumed they were for a forced air duct fitting. Anyone ever seen a TV like that?

Nothing so glamorous as that. The threads were on there to hold a dust cap
in place.

So when did Amateur Bands become NON-shortwave? Did I miss something? My
R5000
doesn't receive 38 MHz or 49 MHz - does that make it limited too?

Okay, I can understand how the amateur-only-coverage is *barely*
germane (since the ads are crossposted into a pair of non-ham groups),
but what *possible* consideration should the color of the poster's
backdrop be? Is it a trademark of a reputed lid, or are you just
being sarcastic?

Hello All:

There is a military U-77 connector and cable assembly which is
useful for getting audio in/out or telegraph key connections into many
of the military radio sets. It is available on eBay right now. In case
anyone is interested it is item # 5816014755.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5816014755&rd=1&sspagename=STRK%3AMESE%
3AIT&rd=1

For those with older military equipment this is a useful item.
It is priced at $3.99. Thanks.

Nanu

Selling my personal collection of ARRL Radio Handbooks. These are all
in excellent condition. Some of the best you will find. All prices
plus shipping.

1934 Excellent condition. Hardbound. Price $40

1937 Excellent condition. Top and bottom of binding taped, but not
torn. Don't know why it was taped. It looks almost mint otherwise.
Price $35

1939 Poor condition. Missing covers but otherwise complete.
Several handwritten schematics inside (on seperate paper) Binding is
tight and all pages included. Price $10

1942 Special Defense Edition in Mint condition. Price $35

1942 Standard ARRL Handbook somewhat rare. in excellent condition.
Price $35

1944 Excellent condition. Small 1" tear in top cover otherwise in
near mint condition. Price $30

1944 Excellent condition. Price $30.

1945 Very Good Condition. Cover torn away at top but still
attached. Slightly worn spine. Price $20.

1949 Very Good Condition. Price $20

1950 Very Good Condition. Price $20

1951 Excellent condition. Price $20

1952 Good Condition. Spine Taped and owners name stamped in top
right corner. Complete and tight binding. Price $20

1953 Excellent condition. Price $20

1955 Excellent condition. Price $20

1956 Excellent condition. Price $20

1957 Excellent condition. Near Mint. Price $20

1959 Excellent condition. Price $20

1961 Mint. Price $20

ALL PRICES PLUS SHIPPING FROM 27587.

WILL SELL THE ENTIRE LOT FOR $400 PLUS SHIPPING

Will consider ALL offers. Might consider a trade of HF rig.

Thanks,

David,
W4IDX

Mouser has non-Greenlee punches much cheaper than the Greenlees. I've
got some and they're fine. There might be a difference in a heavy-use
setting, but probably not for typical homebrewing.

4172. Help with MFJ Antenna Analyzr

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-09 19:40:20 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <43497225$0$24633$4fafbaef@reader3.news.tin.it>
Source record: 16061

This post may be a bit OT, but I believe this is the forum where I can get some useful information.

I have an MFJ-259B antenna analyzer which works fine. I also have an MFJ-269 (the one also working on UHF) which instead gives me odd results on the HF bands.

I then sent the 269 back to MFJ for warranty repair, and when it came back it had exactly the same problem, despite I gave them a very detailed explanation of the problem.

In summary the problem is the following:

- loading the MFJ-269 with 50 ohm all is OK (it gives R=50, X=0)
- loading it with a different value, say a small 200 ohm carbon resistor with very short leads, it gives R=200, X=0 at around 10 MHz but, LOWERING the frequency (e.g. down to 3.5 MHz), it progressively shows an higher and higher X value. This result is clearly wrong as a resistor having 0 reactance at 10 MHz cannot show reactance at 3.5 MHz. This is confirmed by the the fact the MFJ-259 loaded with the same resistor shows X=0 at 3.5 MHz! So, no question about that!

Interesting to note that the MFJ-269 Product Review on QST magazine (May 2005 issue, Table 3) shows EXACTLY the same problem! A 269 design problem which does not exist in the 259?

Reading the MFJ-269 factory calibration procedure (I have a copy of it), they instruct the operator to adjust the instrument at 10 MHz. And at 10 MHz it works fine!

Has anyone carried out a similar test?

Thanks & 73

Tony I0JX (also K0JX when in the US)

I've never understood how one spouse can TELL another how he/she may
or may not operate his/her hobbies. It would seem to me that if it's
really a partnership....well, you get the drift.

Maybe it's time to take the Howard Hughes approach:

"Women? It's cheaper to buy an airline."

And then buy the radios you want.

Well, I would agree. But there is a difference between a spouse TELLING you what you can or can't purchase and a spouse 'suggesting' (correctly I might add) that perhaps 6 or 7 Drake 2B's is enough! hi hi

4177. Wanted: Knight T-150A knobs and manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-10 16:04:34 UTC
From: k5dh@raytheon.com
Message-ID: <miw2f.2$wT.1@dfw-service2.ext.ray.com>
Source record: 16066
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

In an uncontrollable fit of nostalgia, I just bought a Knight T-150A transmitter off eBay. We had one at the club station when I was in college, and I liked it.

I need a set of Plate and Load knobs (the ones with the brushed aluminum centers). Let me know the condition and price, including the cheapest possible postage.

I also need the manual and schematic. I know there are many dealers on the internet who sell manuals. So far, the cheapest one I've found is $20 plus postage. I'm hoping that one of my fellow hams will have one and be willing to copy or scan it for me. I share my manuals FOR FREE (including postage and copying costs!) when I have one that some fellow ham needs. They say, "What goes around, comes around." Let's see if that's true.

73,
Dean K5DH (contact info good on QRZ.com)

So you feel one should be able to fill the house, which one shares with a spouse (partnership as you stated), with radios or anything else related to one's hobby, and the spouse should have no say. You must not be married and if not I see why.

R42

Says: COMM HI-FI with switch at top left to select choice wanted.
Also says Bass Reflex at bottom left.

Very nice condx used with SX-62 ? I forget.

Accept fair offer + ship cost.
If you know it-- is a BIG guy size !
Can do digi pix, I wouldn't buy sight un-seen either.

I can understand it. One spouse (the one with the old radios) begins to allow them to overflow the hamshack and letting them accumulate in the living areas of the house. He might spend money needed for household necessities or on money the other spouse had earmarked for her hobbies or interests. In short, the one spouse (the one with the boatanchors) begins wandering back and forth across that line which separates hobby from mental illness. ;-)

4195. FS: Hammarlund HQ-160 receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-12 00:56:37 UTC
From: Phil Nelson <philnelson@nospam.xyz>
Message-ID: <v5-dnYm8vufQwtHenZ2dnUVZ_sqdnZ2d@giganews.com>
Source record: 16084

For sale, Hammarlund HQ-160 general coverage receiver. $300 plus shipping.

This is a complete, all-original, unmolested (no mods) receiver. Double conversion, 13 tubes, with slot filter, variable selectivity, flywheel tuning, calibrator at 100 khz, antenna trimmer, and more. This one receives on all bands and all functions are operational, as best I can tell.

You can see a photo at:

http://antiqueradio.org/art/temp/HammarlundHQ-160.jpg

More photos and some additional details at:

http://antiqueradio.org/hamm02.htm

(Note that the S-200 speaker is NOT included. I am selling the receiver only.)

I have had this receiver for about 10 years. No restoration was done because none was needed.

This set weighs about 40 pounds on my bathroom scale. I estimate the packed weight at 42-45 pounds, depending on what sort of box I find, amount of packing material, etc.

My zipcode is 98072 if you want to go to usps.com and get a shipping guesstimate.

To ask me a question, kindly go to http://antiqueradio.org/contact.htm and click the email link.

Regards,

Phil Nelson

Source record: 16085

Hi Gang, it's been a good Clough-Brengle day here at Radio Heaven.
Just after lunch FedEX delivered a large package containing
a Clough-Brengle model 87 transmitter. This is the one shown
on my Clough-Brengle transmitters web page,
http://radioheaven.homestead.com/CB87.html
About 5 years ago I lost it to another bidder on ebay in the last
few seconds. About 6 weeks ago I got an email from Bill Fizette
telling me a friend of his knew someone that had a C-B model 87
for sale. The model number didn't register at first so when I got
a digital photo of it I almost dropped my teeth.
It turned out to be the same one that I lost on ebay.
The winner finally decided to let it go. Thank goodness I heard
about before it got taken to a hamfest and sold.
With all the searching I've done I feel fairly confident saying that
this may well be the only surviving example of the transmitter, I've
never seen or heard of another one like it.
On the above web page you'll see photos of it that were used
on the original ebay listing, plus a couple of vintage photos of
Civilian Conservation Corp. stations in the 30s using this model
transmitter.
Now the fun starts, there is some internal damage that occurred
when it was shipped after the ebay sale.

I also picked up at the PO today a Clough=Brengle model 125
tube tested. This brings the C-B collection to 23 pieces.

If you're interested, keep an eye on the above page for updates
on the repair/preservation process.

Best Regards,

Ron KC4YOY

Source record: 16088
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Hi all,

I shipped two boxes of amateur radio equipment yesterday from
Lewisville, Texas to Cooper City, Florida. As always, I used
FedEx Ground. Here's why:

Two packages:
(1) weight 33.60 lbs, size 24 x 21 x 16 inches, insured $900
(2) weight 13.95 lbs, size 22 x 22 x 14 inches, insured $100

FedEx Ground, delivery in 3 business days, cost $38.77
UPS Ground, delivery in 4-5 business days, cost $56.07

UPS would have charged $17.30 more than FedEx (that's almost
45 percent) and would have taken 1-2 days longer to arrive.
To me, $17.30 is not a trivial amount of money.

Something to think about next time you're shipping packages!

73,
Dean K5DH

Dean,

I have been using Fedex Ground and Home delivery for some time now after discovering the same thing you posted here.

You can print label and manifest using their web-based shipping manager and process on plain printer paper. The Web interface is a bit counter-intuitive, but usable.

I have accounts with USPS (Onluine Click and Ship), Fedex (Online Shipping Manager) and UPS (Online Web Interface). I use Fedex for most items over 5 pounds that won't fit in a USPS Flat Rate Box.

On the otherhand, in the last 2 weeks, I have had 4 packages delivered to me by FedEX Ground, and each arrived from 1 to 4 days later than the tracking system said they would. When the appointed day came, they just bumped up the delivery date to the next business day.

In one case, they lied about no one being home. At the time they said no one was home, I was sitting on my porch talking with a friend (and for 1/2 hour before and 1/2 hour after the appointed time.)

I have in the past had a number of crated packages delivered by FedEX Freight, and most cases, they completely and totally destroyed the crates. I was lucky to only have to replace one item from this damage. Once they delivered a 4'x8'x1' crate that weighed 600# in a small econoline van. They couldn't even get the crate out of the van without my help. One guy bloodied his mouth when the crate went over balance, and smashed his head between the crate and the roof of the van... All the while, the drivers young daughter sat on the front seat.

I have never had UPS miss the delivery time they said they would meet. I have never had UPS lie about delivery misses. And no matter how heavy the package, they always bring it to my door

(and use safe methods for moving heavy packages.)

To me, it seems that your luck with delivery is just luck of the draw.
I have a great UPS delivery guy. The FedEx guys are different
every time.

Hi,

Be sure to ask for indirect or direct signature for
fedex home, (fedex ground has signature included no charge)
otherwise they just leave the cartons at the door.

I've been using FedEx ground since they started the
service, 30% less expensive then ups and one day
faster transit times too.

UPS uses company drivers and FedEx Home uses
subcontractors/independants so they have less
overhead, so lower fees.

US Postal flat rate boxes are a great value
for most of the auction items I ship.

Don't spend a lot of money on those self adhesive
ship labels, instead use regular paper and get
one of those glue sticks that the kids use at school,
that turns your plain paper label into a stick on label
for a few cents !

Agreed.

Let me also say that, from my experience, UPS and FedEx Ground break things at about the same rate. But when FedEx damages something, they promptly inspect it and pay out without a fuss, while UPS will do almost anything to avoid paying insurance claims. Admittedly I have had only three UPS issues, but all were nightmares.

Hi

I wonder if anyone in the US has any information on the US made military R744A/PRR receiver? I have one of these 1960s period sets but can find nothing on the net about it (a search will only show what I have posted!).

These sets were powered by batteries or 24v external vehicle supply, had subminiature tubes and covered 20 - 100MHz in one band. You can see some details of my set at http://www.vk2bv.org/radio/r744a.htm

I would like to find a manual (TM5825-203-20-34) plus information on the period and usage of these sets. Surely their use cannot be confined to Australia (they are even rare here), since they were made by more than one US manufacturer!

Simon

I would have to agree that my luck with UPS has been less than satisfactory. but with fedex my stuff gets there a lot quicker and costs less money. i have even sent msr 2000 repeaters across country with fedex for only about 48 bucks, but if i sent them with ups, they would be destroyed in no time. i have a friend that works at the local ups and he tells me that the sure fire way to have something destroyed is to mark it as fragile or handle with care. seems the guys in the warehouse love to kick the hell out of boxes like that.

In my experience it is difficult to get much return on an investment in radio gear unless the item is a noteworthy model in clean condition. Most equipment will sit on consignment shelves or on websites for months without any interest. If storage is a problem, I suggest consignment at a Ham store first, or a trip to a LARGE hamfest. It may take a dozen times to clear any reasonable reserve price on E-bay and without one your stuff may go for pennies on the dollar. You will spend lots of time fooling around. I have some items that have interest to me but no interest to anyone else that have grown old on the shelf.

If space is a problem, your best bet would be to stack it up in the garage or even in the back yard, off the ground and under a tarp. Otherwise you might donate it to a ham club just to get it out of the way.

As for your license, I thought there was a 6 month period where you could renew. You can renew on-line in minutes and it costs you nothing. If longer, try it anyway. If it doesn't work they will send you a letter telling you so and you will know who to state your case to.

Fed-Ex Ground has always welcomed packages from private individuals, while UPS would rather do business with business. UPS finally saw the light over the last year or two due to Ebay, but they've did too little too late.

I've used Fed-Ex Ground for at least 5 years since UPS started opening and inspecting packages accepted via their counters. The UPS counter folks around here are extremely rude... in fact one of them is so bad just mentioning her name to about anyone across the region who has been to their counter and they know who you're referring to. Go to a Fed-Ex counter and you're greeted with a smile. Also love their Ship Manager web processing. Even when there's a line of people at the Fed-Ex counter, just throw your packages on the desk... say "they're done"... and walk out. UPS lost my business long ago.

so true. the people at the ups place here are also rude, uncaring, and
obnoxious. one time they lost a package and the woman at the counter
was told by a friend of hers, "that guy sounds mad", to which she
replied, "oh yeah, we get them all the time", then laughed. well, i
made a really big stink about this and she was fired on the spot. then
it was my turn to laugh. i'm too always greeted by a smiling individual
at fedex. and the ups place here is only open 2 hours a day to accept
packages, which really sucks if you want to do business with them.

If your license expires while you're overseas and in the military, the renewal period is automatically extended: IIRC, until a year after your return, but it's been a while.

I'll follow the JB's suggestion: take an hour and get 'er done.

Oh, and welcome home.

You must just be lucky in your location. As with most everyone here, I've had the opposite experience. The one that really sticks out in my mind was when I was watching the tracking data on the UPS website. The package was two (2) days beyond scheduled delivery, so I checked the site. Package was on time up until it reached the distribution center in, I believe it's Ohio, where, instead of shipping it to me, it was shipped three states over in the wrong direction, then shipped back to Ohio where it finally started it's journey back to me. Ended up being 4 days late!

There are many more horror stories I could tell, and not just my own. Friend of mine shipped a $1800.00 Home Theater Receiver (weighed between 50 and 70 pounds) from Michigan to California. Exceptionally well packaged, in original packaging, then double boxed besides that. When it arrived, the outer-most box was gone (it arrived only single boxed, beside the original), with the original label and remnants of outer box taped to the inner box. That box was mutilated, and the receiver? Well, lets say it had a nice "leaning tower" look to it, along with all but one of the circuit boards being literally shattered...

And then he had to fight for almost 4 months before he actually got his insurance claim. They were only going to give him a portion of the insured value, because they claimed that the contents weren't worth more that that. Well, it was, BEFORE UPS got their hands on it...

Hey Ron,

I know it was a fantisy come true to acquire the model 87. I hope the shipping damage is repairable, and everything can be restored properly.

I guess now that you may have the most complete collection of Clough Brengle stuff in the country, and possibly in the whole world.

I ordered a DVD from Amazon.com. They gave me free shipping via UPS that was supposed to take up to 2 weeks -- I got the package after only 3 or 4 days.

I then ordered a TV from Amazon.com. Free shipping again, this time via Fed Ex Ground. Supposed to take up to 2 weeks, but was delivered in only 5 or 6 days. The back of the box had a hole kicked into it, and the foam inside was broken, but the TV was okay.

Amazon.com, with no state sales tax and free shipping, is a pretty good place to order electronics.

> The ups ppl are union, so they don't care about customer service

Perhaps, but they are also employee owners, so I think they do care about customer service more than you know. I have dealt with UPS in two different cities, and out in the country, and they have always done the great job for me. I am certain there are regional problems, I just haven't witnessed them here.

Could be, then I have been lucky in three different locations,
and for hundreds of packages, over more than 20 years.

HI, I agree!!!! I always use FedEx Ground. It IS much cheaper AND
faster than UPS.
OH, one more thing.
I truly believe FedEx treats YOUR package much better than UPS!!!
UPS does not seen to care much how much "bouncing" so to speak YOUR item
takes.
I'm sure every company has these animals dropping your fragile items.
Its just UPS stuff
gets broken MORE often.
THAT A BOY FedEX..... Put em out of business!!!!!!!!!!!!

UPS has been OK with me, except when you haver to talk to them
on the phone. In one case, they kept calling back to my house. I had
received one of their calls there while home for a doctor's
appointment and told them not to call there again. No such luck. Then
you can never talk to the same idiot twice. They introduce themselves
as "account executives", but these cheap-ass "executives" can't accept
an incoming call -- you get the luck of the draw from whatever
connects them.

Then the dorks go tappity-tap on their keyboards as you describe the problem, but the info never gets to the next dork you talk to -- it's a brand new day and you have to explain the whole damned thing again.

Last year, a friend was getting DSL and the equipment was UPSed to her. On delivry day, she looked at the website during the day (Friday). Late in the day, it was recorded as "no such address". She lives on a short stub (three houses worth) of a street which had a section removed for a throughway -- twenty years ago -- and half the time, they still lose it.

We then told them to deliver it instead to the UPS facility near where she worked -- on Monday, so she could pck it up at lunch time. I did that part for her. The wackos said they had to deliver to an address. I asked why they didn't know the address of their own facility ten miles north. So they changed their story to they couldn't just send it to another facility -- it had to be a house or business address. Since she had just started a new job and didn't want it coming to work on her third day there, I told them to just divert it to my address 25 miles farther north. They agreed to do that.

In the end, I went to her place to accept a completely different furniture shipment (real trucking company for this one) on Monday. When I arrived, the UPS package was sitting on her doorstep. To hell with any instructions UPS had agreed to.

Thirty of those bozos would have a cumulative IQ of fifteen.

A few years back, on salon.com, there was a story of a woman
who went to France and had a major museum ship a rolled-up picture of
a famous painting of a nude, to her son, a fine arts major, at home in
the US.

UPS in the US opened it, determined it to be obscene by their
standards and sent it back to the museum store.

The woman checked shipping policy with all the majors -- DHL,
Airborne, UPS and FedEx. All except FedEx said they'd have done the
same. FedEx alone said that, absent a court order, they wouldn't open
a shipment which was properly packaged.

Employee ownership is a crock of crap. If an average employee
were to do something which made the stock go up a dollar, he'd get
nearly nothing for his few measly (purchased) shares, but the fat cats
at the top would each get a windfall for their 200,000 (given to them)
shares.

Apropos rec.radio.*.* -- that's a hell of an amplification
factor.

I advise against this;
I did a mass-mailing using "glue sticks"
to attach the plain-paper mailing labels.
A large percentage of them fell off in transit.
Spend the extra money for good labels;
one lost package will cost a lot more than you save
using "glue sticks."
IMHO, of course,
Dave S.

I had the USPS return a package to the sender for "No such address".
My shop was directly across the street from the post office. It was all
you could see when you looked out their front windows, yet they couldn't

find it. UPS would leave my stuff at the wrong door, so if i was expecting anything I had to check quite often to make sure someone didn't walk off with it.

What about the "Union attitude"? Any problems that arrise are
attributed to management as they set the standards and rules. Bad
management equals bad employees. The Union employees at UPS are no
different than any other Union employee. All want their employer to
thrive and earn many dollars. They know that more profit is more pay
raise in future contracts.
NOYK in central Florida

In the case of UPS it seems to have more to do with the shipper than anything else.

When I get heavy items from Fair Radio via UPS the box always arrives in pristine condition.

When I get similarly heavy items from random individuals the box is often nearly destroyed by the time it gets to me (and often the contents too.)

Admittedly at least part of the difference is the inexperience of J Random Luser putting a 80 pound radio in a lightweight box filled with styrofoam peanuts...

Tim.

Hi

Can any US readers of this thread explain why Fedex or UPS is so
popular compared with the much cheaper US Mail?

Here in Australia Fedex and UPS offer a service, but few private
individuals would consider using them due to high costs and the
inconvenience when delivery is a problem if people are away at work.
With normal post, we have post offices in all suburbs where
undelivered mail can conveniently be picked up or items posted.

I have never had loss or damage problems with ordinary mail to and
from the US.

Simon

FS: Collins RE 302C-3 Wattmeter NEW!!!
I just got this recently and it was stored away many many years
and it was in a heated place. It looks to be brand new.
Sealed all in plastic. With the coupler and cable collins papers
and tags all inside. Very rare to find one new.
I have pictures if you want to see.
Please make offer on this this find example of history.

>popular compared with the much cheaper US Mail?

Because for packages over about two pounds, US Mail is much more
expensive than the package companies. For light packages, just a
couple resistors or a tube, the postal service is usually a better choice.

For international stuff, I don't know. And I will say that the postal
service is not very good at paying up on their insurance claims either.

I've never noted anything like that.

Our UPS guy has been on the same route for over twenty years. He even brings dog buscuits the dogs on his route. He is friendly and courteous. For outbound shipments, I take UPS items to Staples.

One FedEx shipment for me was delivered to a neighbor who lives on a different road, a half-mile away. Airborne Express brought a fragile e-bay purchase during a snow. Rather than driving up my drive (which I'd done with a front wheel drive automobile, the guy placed the parcel atop my postal mailbox alongside the road where it could have toppled to the pavement or have been easily stolen by anyone.

Hi,

The controls were set in in error.
It looks like a rectifier tube in the test socket
(TV-7 meter set to A shunt),
but there is no cathode pin selected (set to zero).
I hope nothing was damaged.

Ed

Yes different parts of the country are quite different. I gave up on
UPS years ago because it was just to hard to ship a package with them.
I live in Phx and the nearest Depot was 15 miles away. From experience
on the receiving end thought I have had packages arrive in very poor
condition plus have had packages delivered to the wrong address. I have
shipped some items via FedX put from friend experiences collecting
insurance on an antiques or old boatanchors is very hard. If an item is
extremely height it will go FedX. Being I do not ship all that much but
more than the most people I find shipping via the USPO the easiest and
most friendly. There Priority boxes and Flat rate Box services can not
be beat. If I was a business then I expect I would be using UPS and FedX.

Back to boxing for my next run to the USPO,
Ron WA0KDS

Yes, they appear to sort packages automatically by ramming them off one
conveyor belt onto the next (which happens to be 3 feet lower). I think
they also throw stuff off lorries onto concrete - it's the only way I
can imaging the damage to a near mint and well packed WS19 having
occurred, which is why I will NEVER use nor recommend UPS to anyone.

Nice trick. Considering that it's not even plugged in.

I would take bets on it being a refelction from the over head light.

Used a desk lamp with a gooseneck and an open Sherwood to do that once. It had no lights otherwise, was unpowered and it looked damned good.

Postal US now has flat rate boxes priority mail,
$ 7.85 for up to 70 lbx, check it out http://www.usps.com
priority mail flat rate.

UPS, FedEx and DHL offer insurance $ 100 value included in the rates
and are reasonable for more expensive items to insure.

Yes, the insurance at ups is to insure they do not pay the claims.

Postal US mail is more expensive to insure.

OTOH, I get shipments from aes in milwaukee just fine,
fair radio (super pack jobs at fair prices) also.
Those overcharger on ebay shoud take a lesson in packaging from fair radio !

Only had on problem with ups, they did not get signature and I paid for it,
so I called to get them to credit me for the fee and they sent the driver
out the next day to get a signature. what a joke, I protested the fee
on my amex card and they had to refund it. Signature at delivery,
not after delivery.

UPS and Fedex counter people are great in my area.

4252. ICOM 751 Problem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-14 06:37:49 UTC
From: Rick Frazier <rickf@rickfrazier.com>
Message-ID: <434F5262.14E4B7D7@rickfrazier.com>
Source record: 16041

Hello:

I know this transceiver doesn't "glow in the dark" like a _TRUE_ boat-anchor should, but it is getting on in years, so should qualify in the boatanchor category by age and/or weight....

I have an Icom 751 that has begun acting very strangely. It worked perfectly some time ago, then was relegated to a non-operating position under the bench for about 6 months. I live in Hawaii, and the average temperature during this time was about 85 degrees day, and 70-75 degrees night. The humidity varied more, from about 50% to 100%, being on the wet side of the big island.

After the prolonged time under the bench, I fired it up one day to find that I couldn't change bands in the Ham mode. The full symptom is as follows:

Normal function with the T/S button operation, slow and fast tuning changes.

Normal function with the DFS button which (when pressed) allows selecting a memory channel.

Abnormal function with the BAND button depressed. Normal operation is a rotary selection of Ham bands with rotation of the tuning knob. Instead, I get the frequency changing by 125 Khz with each step of the rotation of the tuning knob, within the band that the radio starts in (which currently is 160M band, but has been other bands on occasion). If I select the General mode, and have the BAND button depressed, the display changes by 1 mhz per step, which it is supposed to do. I seem to be able to tune to any frequency I want using General mode, but only a single band in Ham mode. (Given the transmitting range has been "opened" I could probably transmit in General mode on the ham frequencies of interest (haven't tried), but I really want this radio to work like it should.

I've tried replacing the ram board with one from another unit (an Icom 751A) without change of the symptom, so I don't think it's the ram board battery gone flat. I've reseated the flex circuit cables in their sockets, and don't see any obvious damage to any of them.

Given it worked fine when placed under the bench, and developed this problem during "storage", I suspect something related to the period of time it was not in operation, (particularly moisture related) but am not sure what the problem might be, as a similar unit (Icom 751A) in the same location and conditions didn't succumb to this malady.

Any ideas where to start looking? I'm just about ready to haul out the heat gun and elevate the temperature inside to about 90 degrees (F) for awhile to see if it is affected by the currently colder area where I now live up the mountain (daytime highs around 70-72, night times about low 60's with humidity typically in the 60-100% range).

If I can get this unit fully functional again, I have a potential home for it, otherwise it's going onto eBay as a "tech special" sometime soon.

Also have a number of other items going to the news groups first or eBay soon after as the result of some upgrades (I now have both an 746pro and 756proII, so the Icom 751A, Ic-2kl and at-500 stack will be going out for sale soon (probably individually). Will retain my other ic-2kl and at500 for the 746pro stack and AL1200 with Mfj 986 tuner for the 756proII stack, so the shack will still be pretty full. Now if I could only get the tower back up at the new QTH.... [sigh]

Thanks
--Rick AH7H

I had a nice experience with AE once, and only once. It's the one and only time I ever received anything through them. Great record in my book, (0 for 1)...

Received an eBay package. Not too big of a deal, wasn't worth much, but they delivered it to the wrong address. Was delivered to the neighbor across the street, on a Friday. They were gone all weekend, so it didn't get to me until Monday. Worst part, it was on their doorstep, wasn't put in the porch, and it rained the entire weekend. Box and contents were so saturated with water, the neighbor barely go it to me without it completely falling apart...

Worse yet, the label was made out to the proper address, their tracking site indicated the proper address, but when the driver logged the delivery, he even indicated that it was delivered to the wrong address. He wrote the address he dropped it at, instead of the my address; how blind can you be?!

If only the shipper would have given me the tracking info, I could have gone across the street and gotten it myself before it got too wet, but they were apparently too lazy to email it to me, so I didn't find out until after I got the package from the neighbor and looked up the tracking info online.

And sometimes it's the gremlins. Two horror stories:

1. Six years ago I shipped an AEA TNC to Timewave for an upgrade, UPS insured. It was well-packed - I've spent many years doing domestic and overseas packing of fragile household goods and electronic equipment (and during the 1967 War a commercial ocean shipper hired me to so some of it because his regular staff was out doing military service) so I DO know how to pack well. Timewave reported that the knob and shaft on the only front-panel control was bent and had to be replaced. Fast forward to last year. I had to ship another TNC to them, and mindful of the first experience, put TWO INCHES of snug-wrapped bubble-pack around the instrument, then two inches of sheet foam around that. I swear - the packing must have weighed as much as the instrument. You guessed it - Timewave reported that the control was damaged in shipment although the box and the packing was intact.. Go figure.

2. Quite a number of years ago I had a commercial art framer send a one-of-a-kind drawing cross-country to a friend of mine for a special birthday. It went UPS insured. When it arrived, my friend reported that there was a small crack in the glass frame and I reported that to the shipper. They made arrangements for UPS to return the item for re-framing. When it arrived back at the framer, the package looked like someone had used it for a tennis racket. The drawing was destroyed, and unfortunately the artist had passed away and very little of his remaining collection was "on the market". We did manage to get something not really that close, but the "specialness" of the event was completely ruined. I don't know who they used to ship the second time but it got there with no further incidents. Because the shipper guaranteed the shipment, I left it up to their lawyers to haggle with UPS.

The only problem that I've had with the local UPS delivery here is that he leaves the package and rings the bell, and then it's a race to see if I can open the door before I see The Big Brown Truck drive off.

I did some playing with mine after getting it, but didn't see anything like this. I did pretty much the same things, as I recall.

HOWEVER, I did notice that going into the advanced mode and setting it for ZO of 75 ohms that is didn't report SWR correctly (should be 1:1 w/75 ohms attached and it still said 1.5 as though it still was thinking 50 ohms). I called and the "tech" who answered clearly didn't understand (said return it) and I elected to drop it since it worked ok otherwise.

I'll try to find some time to re-check this issue.

"Antonio Vernucci" <vernucci@tin.it> wrote in message news:43497225$0$24633$4fafbaef@reader3.news.tin.it...
This post may be a bit OT, but I believe this is the forum where I can get some useful information.

I have an MFJ-259B antenna analyzer which works fine. I also have an MFJ-269 (the one also working on UHF) which instead gives me odd results on the HF bands.

I then sent the 269 back to MFJ for warranty repair, and when it came back it had exactly the same problem, despite I gave them a very detailed explanation of the problem.

In summary the problem is the following:

- loading the MFJ-269 with 50 ohm all is OK (it gives R=50, X=0)
- loading it with a different value, say a small 200 ohm carbon resistor with very short leads, it gives R=200, X=0 at around 10 MHz but, LOWERING the frequency (e.g. down to 3.5 MHz), it progressively shows an higher and higher X value. This result is clearly wrong as a resistor having 0 reactance at 10 MHz cannot show reactance at 3.5 MHz. This is confirmed by the the fact the MFJ-259 loaded with the same resistor shows X=0 at 3.5 MHz! So, no question about that!

Interesting to note that the MFJ-269 Product Review on QST magazine (May 2005 issue, Table 3) shows EXACTLY the same problem! A 269 design problem which does not exist in the 259?

Reading the MFJ-269 factory calibration procedure (I have a copy of it), they instruct the operator to adjust the instrument at 10 MHz. And at 10 MHz it works fine!

Has anyone carried out a similar test?

Thanks & 73

Tony I0JX (also K0JX when in the US)

Steve,

from what you write I presume you have the 269, not the 259B (which works fine).

As you are the only person who answered me, if you have time could you please re- check your 269 by loading it with a resistor in the range 150 to 200 ohm, verifying that the reactance (X) indication remains nearly zero when varying frequency in range 2 to 10 MHz.

The only 269s I know are mine and the one tested by ARRL on QST. And both of them have a problem. So, if yours does not show that problem, then I have some hope

Sounds like bovine excrement to me. I have dealt with companies in the past that always found certain things "broken" on items returned for repair, even when they weren't. It is a great way of bringing in a little extra money, and the customer has no way of proving the lie... well, unless the company tells the same lame story over and over again like Timewave appears to have done.

>

I'm betting this wasn't packed the way UPS says you should pack fragile items: double box, 2 inches of packing around the item, and 2 inches of packing around the inside box. You cannot just throw a glass frame into a box, and fill the box with peanuts, and expect it to survive. The frame needs a single wrap of thin foam (cardboard thickness), a piece of

wood, or masonite front and back taped firmly. This should then be placed in a sealed plastic bag. This composit should be wrapped loosly with 2 inches of bubble wrap, and boxed. The inside box should then have another 2 inches of loosly packed peanuts. You can set the stage for a great amount of damage to a fragile item by simply packing the peanuts too tightly in the box.

I have *never*, repeat *never* had a problem with UPS damaging an item that was properly packed. On the one or two occasions I have had a damage problem, the items were heavy, and were tossed into the box, with a little bit of crumbled newspaper thrown in on top to fill up the empty space.

Or someone has shipped a BA that originally was shipped with the transformer removed, with the transformer installed... stupid stuff.

That isn't UPS's fault, that is the shipper's fault.

UPS moves quickly, packages literally fly through their hub. UPS gives recommendations on how to pack to survive. If you don't follow them, you are taking a very big risk. FedEX's ground operations are identical to UPS's. FedEX's air freight operations gain some protection from damage by forcing you to use their standardized boxes.

-Chuck

Back in the minicomputer days, we had a disk drive for a DEC PDP11-70 on order. In those days drives were large and heavy, and a single drive might take up one-third of a rack. Well, the freight truck driver pulled up near the loading dock, opened the rear doors and backed the semi up to the loading dock. The driver got out again and looked around for unloading help. Not finding any help, he climbed inside the trailer and rolled the 120 pound crate out the back of the truck and down onto the loading dock. The height difference between the floor of the trailer and the loading dock was about four feet. The driver pulled forward, closed the trailer doors and drove off. Needless to say the drive didn't work, and the shock detector inside the packing crate indicated the drive had suffered at least one large impulse during shipment from the factory to the customer.

I have two 6M Gooney Boxes that I will soon be putting up for auction on eBay, before I put them out into the trash. I consider both of them to be in restorable condition with a little work. I even have 2 sprare 2E26 tubes that will go with them.

I really don't want to pack and ship them, so if you are interested and live in the greater Boston area, contact me my email at hhc3141@yahoo.com. Small bucks will take both!

Harry C.

The cost of the replacement of the control was included in the flat
advertised price of the upgrade so a) it didn't cost me anything and
b) they would have lost money by "just doing it" unless necessary.

>I'm betting this wasn't packed the way UPS says you should pack fragile
>items:

This was done by a commercial art framer and shipper who ships
fragile and valuable artwork all over the world. I'm sure that they
knew what they were doing. The problem wasn't the way it was
shipped by them - a small crack can result from many causes
including stress relief in the glass - and is no big deal compared
to the condition that it was returned in. We had the "as arrived at
consignee destination" pictures and the "as received in return by
original shipper" pictures to prove it.

The bottom line was that UPS figured that this would be covered by
the shipper's insurance so they didn't give a flying fig about
what happened to the package as they repacked it (by their own
request) and returned it.

>UPS moves quickly, packages literally fly through their hub. UPS gives
>recommendations on how to pack to survive. If you don't follow them,
>you are taking a very big risk.

A former neighbor retired as the regional UPS customer service chief
some years ago. The stories she told after retirement which were
similar to mine would make your hair stand up.

Perhaps they now have a better grade of handler ???? I seem to
feel that they have a better grade of delivery persons over the last
decade.

>FedEX's ground operations are identical to UPS's.

FedEx Ground is the former RPM. I have never had problems with them
and lately have done most of my business with FedEx.

>FedEX's air freight operations gain some protection from damage
>by forcing you to use their standardized boxes.

Never had problems with them.

Ya wanna know my gripe with both of them?

I live in Puerto Rico USA and neither of the two will treat this
location as domestic USA. Its International Air pricing right down the
line and discounted "ground" services are not offered.
The Postal Service doesn't have this lack of imagination and gets
"ground" (Parcel Post) here with sea shipping in a few days at rates
parallel with anywhere else in the US.

>Steve.

I don't remember ever getting an answer to this question. However, I re-discovered this unit while moving the mess around, so I went ahead and got it running.

For an old 4-stage (4 each 49-44) TRF, it did pretty well. I could get WWV on 5MHz nicely in the early evening and later I copied CHU at 7.335MHz. I had about 50 feet of wire for an antenna. My Sony did a lot better even with its self-contained whip. Of course, so the my Grundig 100 PE.

I don't have the coil sets for decent shortwave listing (anyone have a spare C-348 or others?), so for now it will mostly be a curio set to WWV. I will give it a try for the 41m band later this fall and winter.

I bought one of this NOS still sealed in the box for $9.95 from Fair Radio Sales in 1970, along with two coil sets.

Steve

It is an interesting gripe. The Postal service is US government subsidized, UPS and FedEX are private companies. Why should they charge you anything other than what it costs them to service your location? They charge everyone else a rate that is graduated based on distance traveled.

Radiomart will purchase a radio on ebay, put it up for auction a week later claiming he has had it in his collection for years, or has more than one and is getting rid of the extras. He nearly always uses a red background and photographs the object to make it appear much better than it really is.

In fairness there are actually import 'technicalities' for shipping certain items to PR and implications of the local tax structure, not unlike the Canadian scenario. Not that they do a good job with the Canadian market either. But UPS/Fedex/etc simply refuse to equally service this market of 4 million US people and the sellers/vendors that have obliged themselves to shipping ONLY via UPS/Fedex wind up refusing our patronage.
I can't imagine them (or the affected vendors) telling everyone in say, the Toronto market, that "sorry, we don't serve that area" but thats the case here and I know Alaska and Hawaii suffer much of the same.
Kinda screwy but thats why its MY gripe! The thieving bandits at USPS work great for me...who needs those others? USPS will get a package to me from NY as cheap as it will get it to California, and often, quicker.

That was decided years ago. Numerous friends who work for UPS
tell me that, maybe ten or fifteen years ago, the beancounters figured
the extra deliveries that could be made instead of waiting for sigs
would easily cover the cost of stolen-off-the-doorstep shipments.

A friend told one of these people that a $600 antenna had been
left in plain sight under his exterior stairway and it might have been
nice to claim it wasn't delivered so he could have a spare for his
summer home.

But they have this wacko deal where it's at the driver's
discretion as to whether or not to require an adult's presence and
sig. I once had some computer books shipped from Amazon. I came home
to a yellow sticky saying the package had to be delivered to and
signed for by an adult. I called about it. No reason was given, but I
was told I could not just sign the yellow sticky and leave it on the
door.

Since the UPSsholes only work when I am at work, I had them
divert the shipment to work, hoping it wasn't some porn mis-shipped to
me for the amusement of the mailroom staff.

It was just my Amazon order, so I called UPS to ask what the
hell was up. They said the driver could make the non-overridable
judgement to require adult presence and sig. The nest they could guess
was that there might have been thefts of packages in my neighborhood,
so he decided to lay on the requirement.

Not as serious, but I once had a drive about 2x3x4 feet in
size merely dropped off by UPS on an unattended, open loading dock --
no signature taken. That was on the shipper for not requiring a sig.
But it stood on the dock, only occasionally attended, for another
three days, with no notice to me -- my company's bad. When I fnally
called the vendor, they chased it down (pre-tracking-website) and
found it had been delivered three days earlier.

Dumb vendor -- when we later replacd a line printer with a
faster one, they were supposed to come and pick up the old one. They
screwed around for four months and finally came around for the
printer, on the third floor of a three-story building. Ha-ha -- by
that time, the freight elevator was out of service for a couple of
weeks for re-building. The vendor had to hire another outfit to come
out with expensive equipment capable of walking a heavy printer down
two wrapped flights of stairs.

I missed your earlier post on this.
Which BC-229 and BC-230 do you have?
They should have names like "BC-AH-229."
I'll dig out my books and see if I can
come up with a sensitivity spec.
D.S.

I have two: a BC-AS-229 and a BC-AR-429. The AS is by Philco and the AR by
Western Electric. I have the manuals, but unlike other Signal Corps manuals,
there is nothing in them about sensitivity or adjustments.

Thanks.

Steve.

> John

Yes, I have that switchable coil set (C-379). Back when I first got
the BC-AS-229, I used it mostly to listen to the continuous weather
report on the beacon band (200 to 400). Nothing down there anymore and
the QRM/QRN is so high here in Seattle, that the band is mostly
useless. Worked great when I lived 10 miles from nowhere.

There's no compelling reason to use one of these radios, other than it
being nice to keep them up and running. They must have been considered
junk for me to be able to get a NIB unit for $10. Certainly no good for
crowded bands.

Now it's 150 lbs except for Hazmat which is still 70 lbs.
I deal with UPS daily and they SUCK!!!!!!!!!!!!!!!!!!!!!!!!
Hazmat non-conus is generally sent Fed Ex and I use them everyday.
Given a choice I would ship DHL or Fed-Ex always!

I have checked the UPS Tracking system for all deliveries made when
I wasn't home and quite a number of them state "delivered to
addressee" rather than "left at destination".

Truth or consequences.....without a requirement for a sig, guess who
always wins.

Steven,
The BC-229 takes me back to my earlier times. I still have the 229 that I bought at a ham radio club swap nite in 1954.

I was mainly interested in the low frequency capability, to listen to the low frequency "A & N" aircraft beacons. I have the coil set that covers 200 to 400kcs, and switchable to the 40 meter amateur band. (Is it the C-398 coil set?).

As far as actual sensitivity specs., I have no idea, but for an old TRF set from the thirties, I was totally impressed.

Of course, on the HF frequencies, she's as broad as a barn door.

I do have a BC-230 transmitter in good condition, and hope to someday pair them up as a viable set.

John

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 16th 2005
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Give a better look to the pictures. In the picture where the lamp appeas to glow the main switch is at ON (though one cannot see whether the power cord is plugged), while in the other pictures it is at OFF. Also some knobs are differently set.

Evidently he wanted to also show the instrument in operation. He plugged the tube to be tested, the power cord and adjusted the potentiometers for test.

Indeed, and it's definitely *not* a reflection: the power light is on
(red) and the "fuse" is glowing yellow and has a nice halo effect
where it's illuminating the front panel. Also, in the photo below
that one, the meter is at half-scale, so it's definitely been under
power at some point in the proceedings.

A trifle academic now since it sold for 330 USD - I hope it's OK,
because that's quite a lot to pay for a basic valve tester.

Chris.

Actually, it's in the medium price range for a good tester. Good Hickoks
often go for $400-$500

4298. FS:Collins 30S-1 Linear Amplifier

Newsgroup: rec.radio.amateur.boatanchors

From: Bill Cohn <billcohn1.comcast.net>
Message-ID: <dcGdnVh-4vje58_eRVn-iA@comcast.com>
Source record: 15987

Greetings,

I have a Collins 30S-1 Amplifier that was obtained from a Silent Key.

This is a Full Power 80-10 Meter Linear with a 4CX1000 as a Final.

The unit is currently wired for 240 Volts and looks to be in excellent shape. I have not tried the unit as I do not have the required 240 volt outlet. This unit will be sold As-Is and needs to be picked up locally at my home in Schaumburg, IL, I will not ship the unit.

I am asking $850.00 and I know these go for over $2000.00 on E-bay.

The only thing I see wrong with the unit is the missing front door over the power supply. This linear was in a custom made desk so the door was removed and not saved by the original owner.

I have posted pictures on the web at:

http://billcohn1.home.comcast.net/Collins/Collins.htm

73 de N9MHT

I am good in the Callbook.

We switched to fedex 2 years+ ago, no complaints.

ups drivers are nice guys (they still bring stuff here, and pick up on
ocasion) but the company (mostly insurence issues for us) sucks.

from my experience, they treat every insurence claim like fraud on the
part of their customers.

used ups for international shipments at the req of customers, they
messed up more times than not.

Hello,

I have a nice, working Boonton Measurements Model 80 that is
unfortunately missing the fine tuning dial and manual.

Is there somebody whou would be willing to sell/photocopy a manual?
Also, perhaps somebody has a junker 80 that they would be willing to
sell the dial off of - OR take a high quality photograph of the dial so
that I can make my own.

Thanks, all efforts I will happily compensate for.

Dave Goncalves

Sounds good price.

This reminds me what happened to me in 1969. I found a Collins 30-S1 at a local surplus store, good price but the front door was missing. One day after buying that amplifier, just when I was about to write Collins asking price for a spare door, I incredibly found the front door at another surplus store, and paid it 1000 liras (about 1$).

Unfortunately today it is no longer possible to write Collins in Cedar Rapids, IA.

That amplifier is still here, close to my chair.

Hi, Bill

Just so you're aware, I want to mention that the 30S-1 door panel
normally pushes a shorting bar away from the HV capacitors.
The door safety switch also is in series with the "off" button
for the HV power supply, so provides a second line of safety.
(Removing the door panel is like pressing the HV "off" button
continuosly).

The shorting bar actuator is mounted on the same subpanel as the fuses.
I assume the prvious owner either defeated these safety features
or had some object in his desk console press against the shorting bar
extension.

Some people change the power transformer to increase the effective
screen to cathode voltage for the final tube, in order to get 1500W
output. In its stock form, the 30S-1 can only do about 1200 W output.

73,
Ed Knobloch

Ed,

Thanks for the information. I was aware of the shorting switch. When the amplifier was in the desk console the desk had a door. That door when with the desk not the linear though.

73 de N9MHT Bill

Given that he ended the auction early, I figure he either found a local
buyer, or had seller's remorse and decided to keep the radio.

Dave
I have a Model 80 that I was using just today. I don't have a ready
source of digital
pictures but can arrange something if some one else doesn't come up with
something.

I do not have a schematic but as I recall the circuit is not complicated.

Back door sale. Nice rig, fine condition. Was probably offered much
more than he expected.

Perhaps you could answer a few questions for me:

1. Is the knob dial marked 0-100?
2. What are the major (numbered) marks? Is it every 10, or 5?
3. What are the minor (ticked) marks? Is it every 1?
4. Is the knob attached to the dial? Or to the signal generator?

Thanks for the help.

Here's how mine is....

1. yes

2. every 10

3. every 1

4. to the dial

To everyone regarding the SX-117.
I attempted to listen in to ECARS during the week, and could not find them. When I found them on another radio, I looked into it. CHU was off in frequency by a good amount...more than what the display calibrator could correct for. I'm sure it is just that routine of adjusting a coil at one end of the band, and a cap at the other end...back and forth, back and forth. But, I am going to send it to WA8SAJ for the task...and whatever other magic he routinely performs.
It'll be back!

Thanks Don.

Does this sig. gen require the use of a 3-6 dB pad on the output?

It doesn't require a pad. This one came with a 20dB pad and a terminated connector. I recall another one I used a lot that did have a pad (6 dB I think) and there were calibration marks on the output attenuator that would allow you to calibrate with or without the pad. For some reason we always used the pad. It was probably a better match.

Item no longer available for sale? He most likely had a good, cash
offer that was high enough not to bother with e-bay any more.

Nice ones are, or were going in the $200 range. They are not rare,
but are becoming popular.

It's not only cheaper to use FedEx they do a better job. We ship computer equipment all over the USA, i.e. will build the Conquest Systems :-) The guys at UPS kick the boxs all over, the guys at FedEx carry them. When we used UPS about 8% where damaged on delivery with FedEx less the .01% of .01% get damaged.

Roger doger Antonio.

Guess I _didn't_ really look @ this back when I got it. SO...I did two things with the same problem showing up. I even remember looking over the QST comparisons and seeing some of the modles WORSE than the MFJ, but now that I think of it I don't remember fi it was the 259 or the 296 they tested nor so long ago. I probably figured they were the same bridge...

I used Huber Suhner 50 ohm loads (really good 50 ohm loads).

From 1.4 to 70 MhZ (just flipped the 269 range switch) they show 49-51 ohms and not more than 1-2 ohms X. All in the series representation (Rs + Xs) Put 4 in parallel for a good 12.5 ohm load and at 4 and 1.9 I see 3-4 ohms of X. this is 25% of R !!

Then, I got an old 1/4 W. carbon comp 180 ohm resistor. At 10 it showed quite close to 180 ohms. I believe it was 176 and around 25 ohms X However it showed up to 70-some ohms of X at 4 AND 1.9 MHz (same at both frequencies). Again around 25% of R.

Being an RF electrical Engineer, I never expected this thing to be right on. I only figures it would get me in the right direction and let me know when I was in a "relatively small" 50 ohm circle. However, you are right. This seems to be quite poor. You'd think you'd see poorer accuracy higher in freq.

73, Steve, K,9'D;C.I

"Antonio Vernucci" <vernucci@tin.it> wrote in message
news:43500d7e$0$20486$4fafbaef@reader4.news.tin.it...
Steve,

from what you write I presume you have the 269, not the 259B (which works fine).

As you are the only person who answered me, if you have time could you please re- check your 269 by loading it with a resistor in the range 150 to 200 ohm, verifying that the reactance (X) indication remains nearly zero when varying frequency in range 2 to 10 MHz.

The only 269s I know are mine and the one tested by ARRL on QST. And both of them have a problem. So, if yours does not show that problem, then I have some hope

4333. Help with adjustments

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-17 21:38:39 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <435419e0$0$20493$4fafbaef@reader4.news.tin.it>
Source record: 15920

Can anyone suggest where, in the US, I can buy a well-assorted set of non-metallic adjustment tools for capacitive trimmers, including those bearing a small metal blade at the end.

And a well-assorted set of non-metallic tools for inductors, including those having an exagonal hole, in various sizes.

Telephone number or e-mail would be most welcome.

Oddly enough, I saw a set at Radio Shack the night before last. Ocean State Electronics also sells some tuning tools, various sizes, as singles and sets.

Dave
I found a dial in my junk box that looks and fits just like the original
EXCEPT the markings (0 -100) are on only 180 degrees of the dial.

However, The metal plate with the Markings can be removed (3 screws)
and turned over so you can make your own marks

Anyway it is yours if you send me an address to ship to.

The original knob on my model 80 has the metal plate staked on
to the back of the knob and it is not removable

Doing what he did?? He took the thing off auction because it wasn't up to
snuff. He said it would be back up when he gets it back from peaks and
tweaks. Some of these guys don't pay attention I guess.

I agree - the set I just bought at the Shack had tuned most of the equipment I have - unless you are working on something very old or oddball, the set will work.

Tony, Mike, Dave:

I second the recommendation. However, while you can, purchase two sets. If you do encounter an oddball that doesn't fit, it's easy to file or trim one of the spares with an exacto knife to fit the oddball. Also, trimming wooden skewers, thin chopsticks and the like will "get you by" in an emergency...

4342. TS-700SP button?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-18 13:31:34 UTC
From: Bob Spooner <rls19@psu.edu>
Message-ID: <dj2tfm$1as6$1@f04n12.cac.psu.edu>
Source record: 15931

I have a TS-700SP but no operator's manual.There are two buttons next to the meter. The right one is labeled "tone" which I assume is to inject a tone from an outboard squelch tone generator.

The other is labeled "low."

What is that button for?

Thanks,
Bob AD3K

4343. TS-700SP mike?

Tone turns on a 1750Hz tone burst- not CTCSS.

Low set tx power to, I think, 1W.

You need a 500ohm dynamic mic, assuming the set hasn't been modified.

Original was a 4 pin plug/socket.

Thanks. I've been using a Drake desk mike, and have had to turn the gain all the way up but my FM deviation still sounds low, so I'm hoping to find the original Kenwood mike model to look for. But with the impedance information from you I may be able to find a substitute.

Bob,

I think the 9-pin plug for the VFO (same pin configuration as a 9-pin
miniature vacuum tube) is the same that was used for the TS-520 VFO
E05-0901-05 TS-820/TS-520 9Pin VFO PLUG $5.04

A service manual will confirm or you can call Kenwood Parts to order
http://www.kenwoodparts.com/

Bob -

You should inquire about the TS-700SP service and owners manual from Paul Yoder, WB3CEZ in Bridgeport, PA . That is really not far from your QTH.

He prints TOP QUALITY manuals - I ordered my Kenwood TS-440S manual from Paul (without his comb binding - I have my own binding system) -- and I am very satisfied with his quality.

Well I did pay attention and it stunk! Price not going hi enough so
I'll claim a problem and pull the auction.
If it quacks like a duck and walks like a duck then it must be.
There are waays to protect his investment, like "reserve".

I came home from work today to find that a guy that I had fixed a radio for a few months ago had dropped off another radio. I called him to ask him what he wanted done to it and he told me that it was for me...if I wanted it. Of course I wanted it....it's a National NC-2-40CS. That thing is huge !!! It weighs a ton too. Other than being dirty as heck...it looks to be in pretty good shape. Has anybody here ever had one of these before ??
Ben

I'm looking for an original manual (or quality copy)
for the Heathkit GW-22A c.b. radio. Do you have one
that you can part with, or let me borrow to make my
own copy of?

Yes, I'm aware of the MANY on-line vendors who sell
manuals, but I'm just not interested in paying $20
plus postage for a photocopy. I'm hoping that one
of my fellow radio enthusiasts will have the manual
and be willing to help me out. That's what we used
to do... before it became all about the money.

Source record: 15853

Ben,

My first "real" receiver, as a Novice ham in the late '50s, was an NC-2-40D (you're right, Ben, there are hyphens in two places if you want to be picky). The 240C--oops, 2-40C--was its predecessor, obviously. Both receivers had a coil catacomb beneath the chassis that slid on rails when the bands were changed. That technique, which I believe was the brainchild of the legendary James Millen, minimized lead length by placing the appropriate coil sets directly next to the RF and oscillator stages, and maximized isolation by keeping the other coils at a distance. The kerchunk-kerchunk as the cast-metal catacomb moves from detent to detent down the chassis when you switch bands is way cool, and the Deco design of the 200 series (there was an NC-200, single hyphen) gives it a special look. (I hope yours came with the stepped feet.) Others seem to agree--Fred Osterman made the 2-40D one of his cover radios for his invaluable "Shortwave Receivers Past and Present: Communications Receivers 1942-1997," which actually includes lots of radios from the '30s. You can find info at

http://www.io.com/~nielw/nat_list/nat_list.htm

The main difference between your C model and my D is that the C was strictly a SW receiver, with six bands. The D added the four HF amateur bands--80, 40, 20, and 11/10 meters--spreading them over four separate scales of their own.

The 2-40D was the final model in a line of National receivers that used the sliding coil box. The complete series is at

http://groups.google.com/group/rec.radio.amateur.boatanchors/browse_thread/thread/2fb966528e94e11/f45a806cf08966a9?lnk=st&q=nc-2-40c&rnum=1&hl=en#f45a806cf08966a9

Many years later, I missed my 2-40D and now have two of them, both awaiting a bit of restoration. The audio is also terrific, with push-pull 6V6's in the output stage.

Manuals are readily available.

Enjoy your new baby! Did it come with the speaker? Does it work at all?

P.S. I should have mentioned that the "S" after 2-40C means an additional band, from 200-400 kHz, and I don't think the S model covers the entire broadcast band--just 1000 kHz and up. I don't think there's much down in the LF band these days except for a couple of utility stations, but maybe I'm wrong.

Avery,
Thanks for all the info on the radio. I greatly appreciate it.
No...it didn't come withthe stepped feet you asked about. It does have a
gov't tag on it saying it was made for the FCC or something like that. As
far as working condition...that's still unknown. I Haven't taken a good
close look at it yet. After I have...I'll fire it up slowly on my variac
since I have no idea how long it's been since it's been powered up. I'll
give an update on it when I get it going.

Suh-WEET! Looks like a great receiver, based on what I read in the books. Take it easy on that bad boy. You might want to sub out the electrolytics in the power supply before applying juice, or just do a complete recap (hint: take notes) and then power up.

If you haven't already found it, here's a manual to download:

ftp://bama.sbc.edu/downloads/national/nc240cs/

Probably used at one of the FCC monitoring stations rather than made for the FCC. If the plastic dial face is yellowed or cracked, by the way, Doyle Roberts makes a perfect replacement at a reasonable price. I don't have contact info handy, but he sells on Radio Attic and you can find his email there.

Ya know, I was just recalling, I was able to make the BC-229 oscillate to receive CW by hooking a wire to the antenna post and running it back near the grid cap of a later 39/44 stage. I'm sure that it would have copied SSB,but SSB was almost un-heard of in '54. And keeping it tuned in would have kept one very busy.

But, I could have done it! Radio operators in those days had at least three hands, and sometimes four were required.

Source record: 15868

I had a TS-700S years ago and dim memory sez the TS700S only allowed
repeater operation in the 146 MHz and 147 MHz portions of the band. About
1977, a new repeater subband was established at 144.5-145.5 MHz.

The SP model from kenwood allowed the proper repeater splits over
the entire 2M band

But a mod was available and I recall modding my TS-700S for the new repeater
sub bands.
--
CL -- I doubt, therefore I might be !

The SP was digital. And I "think" it had the repeater offsets for the 145
range already installed. It's been a while so don't hold this as gospel.
I'm sure someone else knows the skinny.

4382. Looking for schematic of Knight KG-221

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-21 01:28:34 UTC
From: Don Bowey <dbowey@comcast.net>
Message-ID: <BF7D9252.16069%dbowey@comcast.net>
Source record: 15870

The subject says it.

I bought it on eBay to modify it for receiving weather pix at 137 MHz, and having a schematic would be a big time saver.

This is one of the goodies not yet available on BAMA.

I'm willing to pay a reasonable price.

Tnx

Don

Just curious...I don't know the innards of the KG-221 but isn't it an FM rig, or is it AM with slope detection? I'm suspecting that if its a classic FM 'public service' receiver then the only thing usable from it might be the rf stage/tuner.

Yes, it is FM. The signal is FM and is best with about 20 kHz passband and
discriminator if I recall right. It shouldn't be much trouble to meet that
requirement.

Thanks for your response. Was the mod very complex? There seems to be a lot more information on the S than on the SP available on the web, and I've found some places listing service manuals for sale that lump them together. I don't want to buy a service manual for the S if it won't be useful for the SP.

Dan,

Thanks for replying. From what I've learned so far, both the S and the SP had digital displays, and at least one of the differences was the expanded range where repeater offsets would work. They both had a low power button and a button for a tone for use with European repeaters. My SP also has a jack for an external tone encoder but I don't know if the S did.

Apples and Oranges.
The Astatic D104 uses a crystal element (Hi-Z), while the Shure 44 uses a dynamic element (Lo-Z). The response curve (sensitivity to specific audio frequencies from 100 Hz to over 7,000 Hz) of a specific microphone element makes a BIG difference in reproduction of the human voice.

The TS-700S and TS-700SP are analog radios -- both with digital readouts

Don't recall a tone encoder input -- but I built a wein bridge oscillator
inside the TS-700S for my favarite repeater.

As I recall -- the 145 mod kit for the TS-700S was ordered from Kenwood --
fairly easy to install.

w4grw@email.com has a TS-700S -- perhaps e-mail him

Hi,

The T-150A was my first rig,
built from a kit in ancient times.

The T-150A had somewhat more internal shielding than the T-150,
to cut down the possibility of VFO chirp.
I don't recall any circuit differences being advertised.

I got a bad shock trying to neutralize the rig,
so it never became a real favorite of mine.
Also, I operated at first on 6 meters, and so got to know
my neighbors who were trying to watch TV.

QST reviewed the T-150 in Jan 1963.

You can see schematics and chassis top views of the two transmitters by
scrolling down at:
http://www.virhistory.com/ham/kits.html

The only major difference that I can see is that the T-150A has trimmer
capacitors across L-2 and L-3 in the VFO -- probably to try to help with
VFO stability (notoriously drifty on many T-150s). There may be changes
to some of the other component values as well, but they weren't
immediately obvious.

I picked up the NAD tuner from GT a week ago. It appears to be running
fine, after the normal TLC for post-broadcast life (production) equipment.
What is normal TLC?
Standard cleaning
New #86 bulb (slide rule dial illumination)
Replacement of missing M3 and M4 chassis & front panel screws

> 1 Plectron R-720 weather radio, vintage 1976, tuned to 162.40 Mhz, tone
> frequency 1050 hz, has built-in whip antenna and input for external
> antenna, works on either 115 VAC or 12 VDC

Jumpered for 13.8 VDC operation. It hears the 162.40 NWS station (with some
breaks) in Oswego (40 miles away) on whip antenna. Still looking or the
proper power cord (or just plug) - which was proprietary to this Plectron
receiver.

About 30 years ago I qualified with my HQ-180A and an LM freq meter.
Didn't need to hook anything together :)

The problem with a counter and a TS830 is that there are various
oscillators in the 830 that would all need to be summed together to get
into the gnat's hair range. I really don't know how that could be
easily done. I'm thinking old style using an oscillator like the
LM/BC-221 or any good signal generator to beat against the signal and
measuring THAT unit rather than trying to measure the 830.

Bill, so you suggest to beat the signal the ARRL will transmit and then to calculate the signal frequency by using the published transmission frequency??

In that case I still would need to get the signal generators signal in my TS 830 to beat with the ARRL signal. I guess I could connect the signal generator to the antenna input. Do I see this right??

FS:Bird Model 74 Coaxwitch **NEW** 6 Position Coax Switch

I am selling a hard to find Bird model #74 6 position "N" connector
coax switch, called the COAXWITCH. Designed for commercial service.
Has minimal insertion loss. Pull out, turn and push in type switch
handle. Sure locking and tight connection. It is new and unused in
original box and packing with instructions.

Pictures at:
http://mywebpages.comcast.net/ï¿½mnowlen/bird-74-front.jpg
http://mywebpages.comcast.net/ï¿½mnowlen/bird-74-back.jpg
The cardboard is part of the packing and has never been removed.

Useful Freq Range: DC to 10 GHz
Max RF Voltage: 500 VRMS (Note: this is 5KW at 50 ohms)
Atten to unused Channel: 75dB

Frequency VSWR Loss (dB) Max RF Power Rating (Watts)
100 MHz - 0.02 850
1 GHz 1.06 0.09 200
4 GHz 1.3 0.22 75

Original cost is near $500.

$150
+ $10 Shipping in Continetial US

Thanks for reading.

Yes, but you certainly don't want a direct connection to the aerial.

Connect the signal generator output to your counter, preferably using a
"T-piece", so that you can plug a short length of wire into the 'T'
to act as an aerial when you want to do the measurement. Then, let
everything warm up for at least half an hour so that the temperatures

stabilise in the equipment to reduce drift. Keep the signal generator a long way off the target frequency to begin with, then tune the receiver as accurately to the ARRL signal as you can, lock the receiver dial, and then tune the signal generator until you get a beat note followed by zero beat against the ARRL signal. (Turn the receiver BFO off when doing this, so you only have one beat note) . Read your counter at that point, and it should give you the exact frequency.

The accuracy of your frequency measurement will depend on the accuracy and stability of the frequency counter, of course.

Chris.

The VFO cover has three callsigns written in pencil for identification. Two callsigns are similar. the transmitter has a unique history and was featured on an interesting 1950's QST photo cover---it was originally owned by noted DX'er. It was factory built. I sold it at a Hamfest in 1971 or 1972. Just interested in knowing who the current owner is.

Best regards

Well Chris, thanks for your advice.

The problem starts with tuning my receiver exactly to the frequency under consideration. I have a IC R75 and I just tried to tune in WWV without relying on the dial. The R75 has a reversal switch which switches between side bands. Switching back and forth until both pitches are identical should put me right on the carrier, or not??
Well, it is not easy if you try to be precise. When I had the best match I could achieve my dial was off by 15 Hz.

Now the TS 830 does not have such a feature and I wonder how I am supposed to switch my BFO off. Does switching to TUNE do the trick??
Anyway, it is much harder to do this adjustment with the TS 830 than with the R 75.

And looking at my old URM25D using my HP5384A frequency counter the error seems to mount. Even after warm up a slow drift of at least +- 30 Hz seems to be unavoidable.
Combining all these errors and considering my operators error in zero beating the signal I should be lucky to get within +- 50 HZ OF the ARRL frequency. Maybe not too bad considering the equipment and the operator's experience, but quite an error nevertheless....

Uwe

Make as many measurements as you can and then average your own results,
or find a numerical median of your own results. If you 'know' you've
got a certain amount of drift in your counter or sig gen you can simply
back out that number or a portion of it.

Good luck!

Further to Chris's suggestion, Bill, and you probably already know this, but for anyone who has never done it before, it helps a lot to adjust the strength of the signal generator output so that it is the same as the unknown signal. Then, the beat note will be most pronounced and easy to detect.

I used this method for many years with a fixed output generator and a pot to ground, taking the signal from the pot's wiper and coupling it through a small value capacitor to the antenna and receiver input. With care I could adjust the generator's signal strength to match the unknown signal and get a very nice beat note. Got a published error of 2 hertz back in the early 1980s.

Are these unassembled kits, because that's the ONLY way
they could be "MINT".
Kits can't be "mint" if they've been put together.
Mint means NEW, never used.
They might be very good, excellent, super duper,
but they can't be mint.

20 years ago they were high performance, but in these days of digital processors these are antiques by the standards of most stations. Their program handling was never that sophisticated, and they suffer from a number of design flaws. The phase rotators are annoying on most music formats, the crossover points are not optimal for most music formats, there are no input gain adjustments for the individual bands, and the 10 dB boost going into the high band processor was responsible for frequent complaints about their top-end sound.

When properly modified and used with a 9100A they could sound quite good, although not as good as a four-band processing system built with the right discrete processors.

> Was it in mint condition?

Actually, I would rate it as used, good condition when I had it. The insulation on the wires was flaking off and some of the coppper conductors showed corrosion. The 11-meter band was not calibrated and the carbon voltage dropping resistors for the differential keying circuit all burned up in a mini-fire---they were replaced with larger wattage wire-wound components. That's how I remember it after about 35 years.

It's probably rusting away under tons of garbarge after it was parted-out and dumped on the street corner waiting for 'pickup'---when solidstate became the fashion.. However, if it's still out there I'd like to pass it's history along. Personally, I don't have time to play retro-radio. I'll stay on the newsgroup for a couple of weeks hoping for an answer then unsubscribe---the owner can contact me---one callsign is still good in the callbook. Bye...

4437. FA: Vehicular Mounting Base for PRC-104A (makes a GRC-213)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-23 16:11:59 UTC
From: Mark@The.KB
Message-ID: <kgdnl1dce7ki8phsn9tl6u9l171ebuba38@4ax.com>
Source record: 15776

This is the mounting base for the AN/PRC-104A radio set
used in the AN/GRC-213 vehicular radio. The unit includes
Electrical Equipment Mount MT-6234/GRC-213, Amplifier AM-7152/GRC-213,
Antenna Switching Unit SA-2365/GRC-213, and associated cables
necessary to build up the GRC-213 with your radio.

The AM-7152 is an audio amplifier that boosts the audio
level from the R/T and makes it available at the SPEAKER
jack on the amplifier. The AM-7152 also provides audio-derived
squelch for the PRC-104A, adjustable via a SQUELCH
control. In addition, the AM-7152 conditions and filters the
vehicular power to protect the radio from overvoltage, noise
spike transients, RFI, and reverse polarity.

The unit is excellent-appearing and has been checked out
with a PRC-104 and also with a PRC-77. Note that the squelch
feature will work with a variety of sets that do not have that
feature, such as the PRC-77, PRC-25, PRC-74, etc.

"Mil Spec Radio Gear" is my new book from CQ Communications.
I've put together a cross-section of various military
radio gear starting from the end of WWII and continuing to
roughly present day. It has 230+ pages and 200+ photos of equipment
covering this great hobby. Some of you may remember CQ's original
Cowan series from the 60s including the "Surplus Conversion
Handbook" and others. I've tried to continue that tradition for
post-WWII gear, with lots of extra goodies. Here are some links:

Table of Contents on my updated web page:
http://home.att.net/~night-ops/mmfrancis009.htm

Descriptive flyer:
http://home.att.net/~night-ops/milrad/blurb.jpg

Order from CQ:

4446. Tek 650HR help needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-23 18:36:38 UTC
From: kludge@panix.com
Message-ID: <djgl7mgar1@panix2.panix.com>
Source record: 15785
Cross-posted to: rec.video,sci.electronics.repair,rec.radio.amateur.boatanchors

I have a Tektronix 650HR monitor here which recently developed an odd fault..
there is no lumininance on the display, just chroma!

Should be easy to figure out, until I discovered that the manual that I have
is for the Tek 650 and does not cover the 650HR. The only difference between
the two is the chroma detector circuits, which of course are what has gone
wrong on this unit.

Does anyone have a 650HR manual, or docs on the aperture card for the 650HR?
I believe the problem is on the aperture card, as when I disconnect the
aperture card outputs, there is a white flash on the screen rather than just
a color streak. There's a weird coaxial relay on there too which I'd try
bypassing for test purposes if I had a pinout.

Anybody with any suggestions? I know the beast is old, but it has served
well for a long time.

Get a new old capacitor and do it again. If you need a bad can cap, let me know what size it is and I will look through the trash bin and see if I have one for you.

Next time, use RTV instead of epoxy. It's better for a lot of reasons, including ease of removal.

Why the name calling? There are certainly other, less expensive options
that work far better than the old stuff - and are affordable by any
station that can afford to stay on the air... Take the Amigo, for
instance (same company as Orban). Very affordable - very competent -
which is all that Dale was pointing out...

But even if they'd been bought as a kit, they could still be mint.
The meaning then that it would be in great shape (no scratches, no
mods, original paint, etc), and I suppose it might also mean that
it was assembled carefully, but I can't say I've given much thought
to that last point.

I suspect if the wording was "mint kit" then that would require
that it not be assembled, because then it's no longer a kit, and hence
isn't "mint" as the day the builder bought it.

I'm not convinced that someone assembling the kit makes it less pristine,
as in "less than mint". But, obviously if someone wants the kit, any
kit that was assembleed is spoiled goods.

4459. HCRA Auction - Feeding Hills, MA, November 4th

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-24 03:45:47 UTC
From: "Jim, KK1W" <kk1w@charter.net>
Message-ID: <MNY6f.15608$RG4.14849@fe05.lga>
Source record: 15798

The annual HCRA auction returns again with our usual fun and bargain extravganza! Come to Feeding Hills, MA on Friday, November 4th and enjoy a great amateur radio auction. This yearly event draws over 100 people from at least three states. It's a great place to sell your old stuff or go home with a bargain. Win a Yaesu VX-7R in the raffle too!

The particulars:

Date: November 4th, 2005
Time: Set-up at 6:30 PM, auction starts at 7:00 PM
Place: Feeding Hills Congregational Church
23 North Westfield Street
Feeding Hills, MA 01030
Admission: Free!!!!

Here's a link to a Google interactive map:
http://maps.google.com/maps?q=21+North+Westfield+Street,+Feeding+Hills,+MA&spn=0.043945,0.079338&hl=en

The simple rules:

Sellers: Mark your item with your name, call (if you have one) and a minimum selling price (if you so desire). 10% of the sale goes to HCRA (maximum is $10). Amateur radio or computer items only. Please box small items into lots for quick auctioning. If it doesn't sell you bring it home.

Buyers: Bid, buy and go home with a bargain!

The tradition of a great raffle prize continues. Purchase a raffle ticket to win a Yaesu VX-7R Handy Talkie. Also second and third prizes of an ARRL Antenna Book and a 25A power supply.

Coffee, donuts and softdrinks will be available. Everyone is welcome, bring a friend or two along for the fun.

For further information please drop me an email or call. All contact details are on our web site at: http://www.hcra.org.

Greetings,

Addiction is a terrible thing! I've scared up enough room for one of these beasts.

Anyone out there have a T-368 for sale or trade?
Unit must be at least reasonably complete and in good restorable condition.

Cash, or I have several interesting possibilities for trade including but not limited to

TMC RFE-1, 500watt, with solid state AM/SSB exciter
Valiant II
HRO-60
SRR-13
Wireless Set no. 19 Complete

Can meet or pick-up NY, Michigan, Ontario, Quebec.

Thanks,
Keith, VE3TS

I am looking for the band 4 oscillator coil assembly for a pair of Hallicrafter S-40B receivers. I think that the same part from a S-77 or a S-40A would also work.

If you have these parts and are interested in selling them, please e-mail me at spburrows@cox.net.

Thanks

Steve

Acetone will soften some epoxies. So will heat...smoking hot heat.
It would probably be better to drill out the old capacitor, or just
call it a learning lesson, and get a NOS cap from Surplus Sales of
Nebraska, or Antique Electronic Supply (AES). Between the two of them,
you can get just about any old cap ever made.

Also, why epoxy? It isn't like the capacitor needs to be really strong.
Use hot glue next time. Always think reversible.

-Chuck

Chuck,

I was replacing the steel ring on the top with the tabs. The tabs are what gets soldered into the steel chassis.

I am a little bit nervous about buying nos caps. And prices for some of those damn multi-section caps are up in the twenty-thirty dollar price range. Besides I get a very good deal on the little snap-in capacitors that I plunk inside.

regards,
Bob

From: Thermionic <Thermionic@lasthouseontheleft.com>
Message-ID: <D7Cdnb5iDqcoLsPeRVn-tw@comcast.com>
Source record: 15813

Hi, recently I picked up a Heathkit HW-16 and with a little repair and tune-up, its back on the air. Great!, but the receiver seems to have a problem that may be by design or may be something wrong. So far I can't find the cause if it's not a design flaw. What is happening is the VFO seems to get pulled slightly by strong signals in the band, somewhat annoying. It may be that there just needs to be a buffer between the VFO and the mixer (both part of a 6EA8). I wonder if anyone else has seen this happen with their HW-16? Thanks.....T

I suspect it might have something to do with power supply regulation, or
rather, lack thereof. The HW-16 has a tendency to chirp when using
crystals for the same reason. Using an HG-10B VFO seems to cure the
chirp issue since the VFO has an onboard regulator which in turn clamps
the B+ in the rig.
Our friend Biz Wichy has been known to add a regulator to the basic
HW-16 and that seems like a good idea.

Hi Bob,

There really isn't any reason to be nervous about NOS electrolytics,
they are either reformable, or dried out. The shelf life on *any*
electrolytic is only about 2 years, so you should reform any electrolytic
that has been stored longer than that.

If all the epoxy is doing, on this rebuild, is holding the can to
that ring, your dremel tool should do an adequate job of carving
away the excess epoxy.

Good deal or not, your little snap in capacitors didn't do the trick
this time, and you get to do the job again. I hate it when that
happens, but sometimes it does.

Yea Chuck,

What I did was to regard a penciled in voltage on a schematic as real. Previous owner penciled in 600v on the plate supply. So ok I figured I'd stick a 450v cap in each of the two hollowed out cans and I'm good for near 900v with a pair of sharing resistors. About the time I get the caps all epoxyed in I take a look at the new Peter Dahl plate transformer schematic and it says 700v on the plate windings. Sure enough 700vrms is about 1kv, so my two free 450v caps aint gonna hack it. I got some free 30mmx30mm 220uf 400v cans. I'll get two of em into each can this weekend and I'll be ok.

Into the transmitter for about 500 bucks now and it's worth about 200 working. Needless to say I don't want to burn out the new transformer with a botched recap job.

There was a review of a recent line of Rockwell/Collins mechanical
filters somewhere in the last years of "Communications Quarterly" so
I suspect they are still being made.

Collins mechanical filters were always costly. Surely some of it
is because they aren't simple to manufacture. They also supply
good performance. They were never a mass item, so there was nothing
to drive cost down as demand went up.

Note that commercially made crystal filters also carry a relatively
high price tag.

You're in pretty deep with that one!

I can't help with the Model 101 schematic but I do have the model 201 which is similar, only a year or two later. It might help guide you around. Looking at the schematic you'll certainly NEED a guide.

Email me if you think the 201 one would be of any use.

My audio output transformer is fried. I'd like to fit one of the same
dimensions; heck, I'd like it to be an original Drake unit.
Anybody have a TR-3 they are using for parts?? Or, more practically
speaking, have some unit with a 6AQ5 output they don't want anymore??

The ARRL Hints and Kinks book has a nice one. Takes a 100 KHz crystal
and uses a single low-grade MOSFET.

Hammond makes an equivalent that ought to fit.

If you absolutely want it to be original, you can rewind the old one, or
send it to Peter Dahl and have them rewind it.

I was thinking of rewinding it. It's been quite a while since I've done
that, and the core was much bigger (old color TV set power transformer
rewond to power my ARC-5)
but I might give it a whirl...

Hola Amigo's...

Biz Wichy here (WDï¿½HCO)

Hi Bill and Thermo

He's talking about the VFO in the RX section and to answer your question Thermo - NO - that's not normal. I have 3 HW-16's and none have ever done that.

So lets fix her...

First step is to switch V3 6EA8 with the Het Mixer V2 6EA8 and see if the problem goes away. There's one chance in a million the tube is the problem... if that's it then you really should be playing the lottery!!!

Second step - try swapping the 6EW6 V4 IF AMP with 6EW6 V1 RF AMP and see if the problem goes away. This one stage away from VFO/MIX but it's worth tryin cause it only takes a second and well who knows...

Third Step - possible cold solder joint. Give a good going over all the joints in the that part of the circuit board. Pay particular attention to wire "X" that connects L7. Make sure it's as short as can be and no other wires come near it. Make sure the copper island on the board where it lands is clean (i.e No Rosen crap).

Fourth Step - check all the entrances and exits of the VFO circuit. In this case there is only two. Check R33 47K 1W resistor to see if its within 20% of the 47K value. Just left up one leg and check with a VOM. This little guy connects the +310 VDC bus and drops it to +95 to the plate of the triode section of the VFO 6EA6. Hook the resistor back up and check the +95 voltage with a ANALOG VOM. Tune in a strong signal and see if it dips as you rock the tuning knob. Next - lets check C56 cap which goes into the cathode of the VFO MIX. If you have a cap checker - fine and dandy - if not remove C56 and solder 2 2" 20 gauge vinyl coated wires and twist them together loosly three times. That should be near 680 Puff. Turn on the set and see if the problem went away. If not - put C56 back in place.

At this point - we can conclude that VFO might not be the problem. A likely suspect could be the BFO Circuit - V5B which uses a 12AX7. since the '16 only has one 12AX7 you can't sub unless you have a spare 12AX7 - then try it.

The fixed freq BFO is directly mixed with the IF sig at T3. R51, C72 and C77 could be troublemakers. The best way to check it is with a FREQ Counter. If you don't have one - use a good shortwave rcvr. Attach a wire antenna and bring it near T3 and tune it to the BFO freq on 3396.4 KC. Turn on the

Shortwave Rcvr's BFO and get a good whistle. Now tune the HW-16 to a strong station and see if the HW-16's BFO shifts around.

Well that should be a good start. Please post what your results were.

Hi Bob,

That hurts!

The two series connected 450WV caps would be ok with a no load voltage of 980V. It was a pretty common practice to let things like that happen back in the day. The capacitors will respond to the excess voltage by building a little more oxide layer... assuming that they are in good shape to begin with.

But you will be safer going to the higher rated caps. If you are going to stick two 400V caps in the same can, be warned that the plastic sleeve on the 400V caps isn't good for 400V. Use some better insulation. I got a serious arm-to-arm shock trusting some capacitor insulation when I foolishly clamped a cap to a floating chassis. I learned a couple of important lessons that day!

You can use a 1 Mhz crystal and a divide by ten. A lot easier to
find, and a lot less expensive.

I downloaded it from http://bama.edebris.com/manuals/heath/hw101/ but .... the schematic diagram quality is poor. Components values can be read but with difficulty.

Hard to understand why volunteers do not generally pay enough care to reproduction quality. Look at how bad that DJVU- compressed diagram has come out.

Best results are obtained with GIF and PNG. JPG is unsuitable for schematic diagrams.

There's lots of freeware out nowadays that will let you convert
anything to pdf (and vice versa) by setting up the program to behave
as a printer. You hit print and select the program instead of your
normal printer and bingo, you have pdf.

In the case mentioned there's no point in doing that since the scanned
resolution is bad it will remain bad in any other format.

My "universal" converter is one planet short of a full universe.

There are times when a poor quality schematic is better than none at all.

The hw-101 files are not unusable.

Well there were other manufacturers who made mechanical filters in
the sixties. You'd see them in the Lafayette catalog, and mentioned
in reviews (though I've always wondered if some of those reviews got
it wrong, and they weren't mechanical filters). But they were never
commmon. They were cheaper than Collins filters, but I have no idea how
absolutely cheap they were for the time. I don't recall coming across
real specs in the old magazines, either. I also recall in recent years
that it was those other filters that used foam rubber inside, and by
now much of that has deteriorated.

And of course, for a lot of things ceramic filters filled the need
for a filter better than a string of IF transformers (or a single crystal
in a phasing arrangement), but at low cost. You see them in most cheap
am/fm radios now, where their size and cost is likely why they are
used, through shortwave receivers costing hundreds of dollars, to even
ham transceivers (though in that instance they tend to be used in
conjunction with some sort of better filter). And the ceramic filters
do cover a lot of territory, going from those three terminal ones we
see in the average am/fm radio, to multiple pole filters seen in those
more expensive bits of equipment.

Plus, it gives you markers every 1MHz, which can be useful.

Yes, after logic ICs became available in the late sixties, the trend
was towards a crystal higher than 100KHz. It doesn't even have to
be 1MHz, 10 or 4 or any exact multiple of 1MHz will do, since it
takes really no more circuitry or cost to divide by 4 or 10, or
whatever first. And once the divider chain is in place, one
can have other output frequencies, like 50KHz or 25KHz for those
bands that don't end on 100KHz multiple.

I'd never given thought to that. Was it the concept of mechanical
filters that Collins had patented, or just a specific implementation?

SOmeone once wrote a receiver construction article, I think it was
in CQ, in the early sixties, that described how to make your own mechanical
filter. Despite the number of times I've mentioned that in the newsgroups,
I've yet to dig out the article.

I had that happen with the filters in my NRD-515 JRC receiver.
Fortunately, it wasn't too difficult to open the filters up, which
allowed me to dissolve the old foam rubber
blanket that cushioned the mechanical filter elements. The
foam had to decayed to a chewing gum consistency and the
filter losses skyrocked. These were late 70s or early 80s
vintage IIRC. Regarding the patent issues, I don't recall
the particulars.

Well..... Most people do what they do, as well as they can. This is true in business and especially true in hobby pursuits. Only a few disgruntled people start their day looking for a way to screw-up something.

The people who donated their time and other resources to copy documents and transfer them to the BAMA sites, did as good as they could given what they had to work with, including their individual knowledge of "what is the best format."

I think the BAMA sites are still a great work in progress, and everyone who has a schematic and/or a manual that is better than the one filed on the BAMA site, should upload theirs.

Antonio Vernucci wrote:

> Very true. But why doing things worse when they can be easily done better.

The technology to produce high quality scans has been around
for almost 15 years. in early 1992, I produced for a client a CD ROM
with a hypertext database of article abstracts about their product and
it included 300 dpi scanned images of the articles.

To put it in context, I had to write a display and print program that
ran under DOS!!! because most people did not have Windows. In fact
we only made 500 of them because there were so few people with CD-ROM
drives. :-)

My CD-ROM drive cost me over $700, about half of a 386 computer without
one.

Now that everyone has a computer with a bitmaped display and many people
have scanners, you would think that there would be no problem getting
a good high resoultion scan of the manual.

However, most hams are computer users and not computer experts. They scan
images with whatever program that came with the scanner and use whatever
settings it defaults to. Unfortunately that's usually 200 DPI and 75%
quality JPEGS. Fine for scanning a copy of your photos for a web page,
or if you go directly to an inkjet printer or fax machine, but not
an archive copy of a drawing printed with a printing press.

File size grows geometricaly with the number of pixels you scan, a
letter size page at 300 dpi is 1,000,000 pixels. Lucklily the standard
for fax machines, uses a special compression method that works well for
black and white images and you can use it to compress a page of text
to about 50k. Line drawings tend not to be much more as it is designed
to work best with linear objects.

JPEG is not, it's designed to work with clumps of pixels that look alike,
and many colors. It is designed to make the copy look like the original
to the human eye, not be lossless compression.

So the bottom line is if you have any material in your library that
you would want the next generation to see, scan it in at at least 300dpi
and save it as "G3" encoded TIFF files.

If you have anything that you think people would want, but can't
do it yourself, ask around, there may be a local ham that could and
would do it for you.

Geoff.

Yeah, I will be printing it also to carry into the shack. Thanks for the troubleshooting process!! I have already tried changing the 6EA8 with 2 others, that was the first thing I tried. Checked voltages with a mil surplus VTVM to look for shifts in voltage, and don't see anything there, but did not check the bfo circuit. The idea crossed my mind though.Checked all resistors in the circuit and they seem ok, but did not actually lift an end, I know I should do that. I do have a few cap checkers, and was about to check C56 the other day, but I have a bad cold right now, and my energy just gave out. I wanted to check the VFO freq and the bfo freq with my counter too. I don't have a lot of time for radio these days, working like a dog. I will post any results when I can. Thanks!! Oh, and about the chirp using xtals, I had already found someone's fix for that, but have'nt tried it yet. I find that some of my xtals don't oscillate well in this rig for some reason. I have about 2 1/2 dozen good 40M/15M cw xtals, but some don't startup well. All of my 80M xtals are ok though. Adjusting the oscillator coil did not really help. Anyway, here is the chirp mod that I found.:

Date: Thu, 29 Jan 1998 09:04:54 -0800 (PST)
From: Ken Gordon (email address deleted for his sake)
Subject: HW-16: Eliminating Chirp w/xtal control...

1) Change OSCILLATOR grid leak from 47 kOhm to 100kOhm

2) Connect a 100 pfd silvered mica or other high quality RF capacitor from oscillator screen grid to ground.

3) If you really want to go hog-wild, feed the screen grid through a good 1 to 2.5 mH RF choke, by-passed at the "cold" end with a .001 - .005 mfd cap, from a 150 volt regulated supply.

Results:

No chirp, even on 15 meters.

Does the name Kokusai ring a bell? I used one in a hoimebrew set in the mid-70s and it was a really good filter. But alas, I recall hearing later that this was one of the brands that had the foam problem.

I will add only one thing to the advice....

Many image problems are due to not having good brightness/contrast because the scanner sees mostly white. Do a few sample scans while adjusting the brightness and contrast for best result.

Hi,

The "DX Engineering" rf speech clipper models
made for both the Collins 32S-3 and for the KWM-2
used a Kokusai mechanical filter following
the clipper stage. You'd remove a tube
from the IF strip of the Collins transmitter,
plug the DX Engineering device into the tube socket,
and plug the tube into the DX engineering device:
and Bingo, you have a speech clipper available.
There was a toggle switch included for in/out control.
Your effective clipping level was determined by the transmitter's
original audio gain control.

They sounded pretty good on the air,
compared to many "processors" of the time.

The British KW company used a Kokusai filter
(model MF-455-10AZ) in their KW2000 SSB transceiver,
which was pretty highly regarded.

A Kokusai filter assembly (including two matching transformers)
cost around $20 in the Lafayette catalog.
A Collins filter cost about twice that in the early 1960's.

I saw a Popular Electronics article, about adding a mechanical
filter by replacing an existing IF transformer in a receiver.
In the article, he used a resistive load in the plate circuit
of the previous stage, and capacitor-coupled
to and from the two Lafayette matching transformers.
I guess he didn't trust the transformer voltage rating.

I recall a Japanese web site had pictures showing
the disassembly and cleaning of a Kokusai filter.
I believe he used acetone to clean off the gunk
that had once been the foam plastic shock absorber
surrounding the mechanical filter disks.

73,
Ed Knobloch

Did you download just the manual file or did you also download the "improved schematic" djvu file? It is realy better than the schematics in the manual page.

When uploading scanned manuals if you have a dial up line sending scans takes a long time so trading of scanned resolution for upload time is something that also enters into the equation.

When I didn't have broadband I wound up sending CD's to Ken since the upload time was prohibitive! I have some gifs of the schematic that I can send you if the improved version is not clear enough.

I downloaded both the manual and the improved schematic. The manual is OK but in the schematic diagram many values cannot be read, so it is difficult to trace the components on the boards.

> When uploading scanned manuals if you have a dial up line sending scans
> takes a long time so trading of scanned resolution for upload time is

True. However DSL is getting common and common. So it could be wise to upload two versions of the same diagram, one high resolution and one low.

I got no answer to my question on the UK ham newsgroup, so I try here.

Many years ago Lee Electronics (London, 400 Edgware Rd,) used to sell small coaxial switches labelled "Coaxial toggle switch". They consisted of a small nickel-plated brass cube bearing, on four of its faces, three UHF-type connectors and one small lever. Those were UK-made items.

Since Lee Electronics closed down, I never saw those switches on sale anywhere. They are noy easy to search on Google.

Does anyone know where to find them?

Thanks in advance & 73.

Should you instead want to buy a brand new one, still sealed, look at E-bay item 5823786147. It is a spare part of the Yaesu FR-DX400 receiver (1967)

Presently at about 30$

Just in case you don't find what you are looking for: Dow-key makes nice
coaxial antenna relays, and many of them have an additional set of contacts
that can be used for muting. I see eBay has bunch, many of which are new.

Thanks, but I have plenty of relays, Amphenol-FXR, Dambury-Knudsen, Thotsu, Transco, Radiall, Dow-Key, etc. etc. The nice thing of the toggle switch is that its male UHF connector can be directly screwed onto the transceiver UHF connector, and moving the small lever you can select two antennas. Very small and handy.

I have two of those toggle switches, bought around 1980, but I would like to buy more now. Noone seems to sell them!

Source record: 15719

I'm looking for a pair of ~455kc adjacent 'channel' xtals for a rcvr project. I gather that the series of FT-241s that had channel numbers like 326 and a freq up in the Lo-VHF (20-30 Mc) range...or those with ch. numbers in the 10s-70s that are marked in the similar VHF range are what I'm looking for. Not the FT-243s from ch 270-389.

I know the ones close to 455kc fundamental are the $ primos and I would have no problem with something else anywhere from 400-500 since this is a homebrew set and being spot on at 455 is not an issue.

A pair of adjacent ones would be great...or a adjacent single to match my 'in stock' ch 46/24.6 Mc or ch. 18/21.8 Mc.

TIA,
Bill

4535. HCRA Auction - Feeding Hills, MA, November 4th

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-29 14:55:09 UTC
From: "Jim, KK1W" <kk1w@charter.net>
Message-ID: <i3M8f.17353$0d3.8911@fe06.lga>
Source record: 15724

HCRA is asking all auction attendees to help the ARRL and the Salvation Army with their Toy Drive for 2005. If you're able, please bring an unwrapped toy with you to the auction. We will gather them together and bring them to the ARRL for distribution to displaced children from the Gulf hurricanes. Thanks in advance and don't forget to attach your QSL card to your donation.

Now on to the auction...

The annual HCRA auction returns again with our usual fun and bargain extravganza! Come to Feeding Hills, MA on Friday, November 4th and enjoy a great amateur radio auction. This yearly event draws over 100 people from at least three states. It's a great place to sell your old stuff or go home with a bargain. Win a Yaesu VX-7R in the raffle too!

Only a week away - have you got your stuff ready??

The particulars:

Date: November 4th, 2005
Time: Set-up at 6:30 PM, auction starts at 7:00 PM
Place: Feeding Hills Congregational Church
23 North Westfield Street
Feeding Hills, MA 01030
Admission: Free!!!!

Here's a link to a Google interactive map:
http://maps.google.com/maps?q=21+North+Westfield+Street,+Feeding+Hills,+MA&spn=0.043945,0.079338&hl=en

The simple rules:

Sellers: Mark your item with your name, call (if you have one) and a minimum selling price (if you so desire). 10% of the sale goes to HCRA (maximum is $10). Amateur radio or computer items only. Please box small items into lots for quick auctioning. If it doesn't sell you bring it home.

Buyers: Bid, buy and go home with a bargain!

The tradition of a great raffle prize continues. Purchase a raffle ticket to win a Yaesu VX-7R Handy Talkie. Also second and third prizes of an ARRL Antenna Book and a 25A power supply.

Coffee, donuts and softdrinks will be available. Everyone is welcome, bring a friend or two along for the fun.

For further information please drop me an email or call. All contact details are on our web site at: http://www.hcra.org.

Source record: 15725

Beg to differ. When I received an SP600 and cabinet from the US, FedEx had dropped it hard enough to break the mounting screws for the radio. It popped out of the cabinet and did the shake, rattle roll bit. They refused to pay. Initially saying inadequate packaging even though the person saying this had only seen the inspection report which was not accurately filled out. The story goes on and on. Finally I filed with small claims court and in about a week I got a call from their lawyer wanting to settle.

When FedEx works, it works well.

Pay attention to the "small print" which you have to go find somewhere in their website. They do NOT offer insurance on Ground. They do offer the opportunity to increase their liability coverage for a fee, i.e. how much you can hold them accountable for. This is the "extra" you are paying for and is required by US law. Otherwise they are limited to $100 liability.

Note that when you do find the relevant document (which doesn't show up at all when you fill out the online paper work), they exclude "antiques". Never, ever tell them you shipped a vintage radio.

Other weasel words I have seen on many company names these days.
Are LLC instead of INC or CO .... I found it to be the acronym for
Limited Liability Company. Anyone know what this means for them
to weasel out of being liable? Seems like most companies are going
to similar labels. I don't want to be liable for nothing either, but
Sheezzzz!!! Do we all expect to get shafted from every place we
do business now? Any enlightenment appreciated.
Any lawyers out there? Can they really do business and not be
responsible for the services and products they sell?

Maybe not exactly on target for boatanchors, but applicable to
all of us these days me thinks.

You're confusing liability for damages with liability between partners
of a corporation. Same word, different context.

Here's a brief explanation taken from the web.

Liability Issues of a Limited Liability Company

In a limited liability company, a member's legal liability is limited to
his or her investment in the business. Generally, a member's personal
assets are not at risk, but a member's personal assets may be at risk if
any of the following occurs:

*
A member personally guarantees a business debt.
*
The form of business is found to be a sham (not properly formed
or maintained).
*
A member becomes personally liable as a result of his or her own
acts or conduct.

Ok. I see now. But still not a comforting thing to see hang on a
company title. At least for me. Looks like they are making a
hedge on legal proceedings before they even do business. LOL

Maybe goes along with never reaching a real person on the phone. :-)

Thanks for raking some of the muck off the new business jargon.
I can feel a little less exposed now.

Well, I suspect your instincts may be somewhat correct regardless. Many
LLCs exist because the owners want to protect themselves against each other.

4548. Improving the Drake TR-3

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-10-30 14:32:49 UTC
From: Steve Reinhardt <stevereinhardt@noearthspamlink.net>
Message-ID: <mQ49f.32633$E17.9136@fe03.lga>
Source record: 15737

I just repaired my TR-3, and put it on the air. I'd forgotten what a nice rig it is. Now, I've started to think about how much better it could be. What if one was to rip out the entire frequency control section (VFO, xtal osc, mixer, etc) and replace it with a DDS synthesizer. It turns out that the display would fit in the opening of the tuning dial. There would be excellent frequency stability, no backwards tuning on 20M, 2-3 less tubes to save heat and power. It just wouldn't be a Drake anymore...

And don't get me started on a lightweight switching supply to replace the AC-3. I might do that anyway, since I wouldn't be destroying any hardware.

So, what do you all think? Is this a Good Idea, or a Bad Idea? Should I try to find a cruddy TR-3 and do the surgery, or am I just being silly? Your comments and critique are welcome (he says, ducking for cover.)

If I should go ahead, does anyone have a TR-3 (or TR-4) that's fairly complete, but not working, they'd like to sell me as the basis of this?

Call me Dr Drakenstein!

First of all everyone needs a hobby for those cold winter nights
when the band is not open. If I had the time and energy, I would
look for a well used TR-3 and have at it. It would no longer be
a Drake, but something that gives you the satisfaction of
accomplishment when it is all together and working.

Leanne,

Thanks. I'm keeping my eyes open for the right rig. I've already got an order in for the Norcal FCC-1 frequency meter. It then can bolt up to a 9850 DDS card, and provide all I need. I think. I'll certainly have extra parts for the working TR-3...

Steve -

There was a TR-3 parts rig on eBay (may still be there) that would be a
starting point for such conversions.

IF you want DDS, then build it outboard and use with TR-3 like the old
external VFO for TR-3 was used.

Remember a few point about these "conversions"

Removes value (zero) of radio for anyone but you. It is rare for a "major
conversions" that you described to raise the value of a radio.

With your time and $$ .. go build an Elecraft K-2 .... you won't be
disappointed.

Of course, UPS only asked for the bandwidth. It was the FCC
and congress that gave them what they asked for. What UPS wanted
to do was perfectly valid, and a good idea too. If there is any
blame to pass out, it rightfully belongs to the FCC and congress.

Is there anyone who hasn't ultimately benefited from the ability
to track their packages? UPS forged the way, but all shippers
now provide the capability. It just happened that the existing
cell phone infrastructure was a more practical way of providing the
tracking service than was building an entirely new infrastructure
on 220MHz... something that, in hindsight, the FCC should have
realized.

The FCC is Reactive not Proactive. The latter would require thought.

Been there, done that. Well, not SSB, but my first rig (1969) was an
ARC-5 conversion. I actually got to keep quite a bit of the guts and
still make a few QSOs. It was paired with a Hammarlund HQ-120X...

My proposal will surely result in a worthless radio, from a resales perspective. That's why I need to start with something of little worth, and why I'm reluctant to dig into mine. It's not the prettiest, but it is working and largely original. Someone already got the mike connector; it's a standard 1/4" now. Most of the rest seems faithful to the original.

Still, it would be interesting to have the 300W input, and smooth AGC of this unit with modern tuning. I'll save the truly modern stuff for my R2-PRO and T2 system. The IQ-Pro DDS is almost ready...

Thanks for the pointer on ebay. I'll check it out!

They were fun... About twenty years ago I started a collection of ARC-5
stuff with the intentions of writing an ariticle for, perhaps, QST. I
actually have a copy (in pristine condition) of a publication (first
edition, first printing, April 1961) by Western Radio Amateur Magazine for
conversion of a BC-453 to a complete 40 meter transceiver. It was a design
by Ed Marriner, W6BLZ and Ernie Mason, W6IQY. Too bad not many Command Sets
are left---few remain after all the conversions and parting out. I had a
trailer full of the equipments that I eventually donated to a War Bird
restoration outfit. Perhaps your TR-3 (my first real SSB rig) would be
better off restored to like-new condition---there were considerably less
TR-3's manufactured than Command Sets.

But once again, equipment is meant to be used, not kept in a museum.

People converted all that old surplus stuff because it was cheap, plentiful, and often didn't do what they wanted. Same reason people added things to their commercial rigs; the additions made them better to the owner.

It's only years later that people are grumbling, because they want pristine equipment for the sake of collections. Of course, one irony is that some of the impact of the equipment today wouldn't mean anything if there hadn't been culling from routine use over the past decades. If I could still go into a local surplus store and buy a Command Set transmitter for $9.95, as I did about 1972, then there'd be plenty of them and little interest. It's only because of the culling that they have become valuable.

Look at comic books. 35 years ago, I bought them to read. I didn't buy them to collect them, I didn't buy them for the art. And when I was finished with them, I got rid of them. They are valuable now because they were used back then, and so they are now relatively rare. And of course, some of those who want them so badly are the people who made the mistake of getting rid of them decades ago. I include myself, though I don't desire them enough to pay money for them. But in recent years, comic books have become more about "collecting". Buy them, try to figure out titles that will be valuable, and keep them "mint" in plastic bags from the start. If you want to read them, then buy two copies. That will ensure there will be a big supply decades from now, but it also means there will be no appeal to them.

People could have decided decades ago to buy equipment for the future, ie buy them keep them in the box and never use them. That would be the best situation for the future collector. But then the equipment would have never been used for its intended use, and not only would there be an ample suply now, but if nobody had used the stuff back then, the appeal of reliving the past would be less.

Drake already did that. They took a TR-4CW, converted it to all solid
state and repalced the PTO with a synthesizer. Called it the TR-5.

Nice rig, but they only sold around 1500 of them.

Geoff.

"Drake already did that. They took a TR-4CW, converted it to all solid state and repalced the PTO with a synthesizer. Called it the TR-5. Nice rig, but they only sold around 1500 of them"

Nope> I have a TR-5. It has an analog vfo. There is a separate synthesizer for the TR-5, but it made of unobtanium and priced accordingly.

The TR-5 came out after the TR-7 with the intent of being a poor man's TR-7. But, it was priced the same as the Japanese rigs with a synthesizer and many more bells and whistles.

The TR-5 is really closer to a solid state KWM-2 than a solid state TR-4. it is one of those perfect for your deserted island, where you cannot get parts.

Yeah, thus my point about getting a basket case to play with. My current
TR-3 will be cleaned up so it's representative of the best 1963 had to
offer. The 'new' one may fall under the doctor's knife (;-)...

Tony - I think the person has the model number incorrect. It looks like the "2-NB" noise blanker which is an accessory for the 2-C receiver. You can see the description here:

http://www.dproducts.be/Drake_museum/2-nb.htm

Being easier doesn't make it more effective. Would you boycott
Chevrolet because someone robbed your favorite bank and used a Chevy
as a get-away car?

UPS thought they needed some spectrum, and they asked for it. FCC
didn't see significant usage of the 220 band, and offered it up.
FCC could just as easily have offered up a small chunk of some
microwave band.

All votes are equal in value, but not all voters. Some just
vote what the newspapers, and the parties say they should, others
write letters, make phone calls, create blogs, ... They get more
political power than the usual voter. If you want to get the spectrum
back, start lobbying for it. Come up with a reason why hams should
have it back... We probably won't get it back, on account of ham
radio being among the "walking-dead". (and yes, I am a ham, so I
get to make observations like that.)

They don't violate part 15! They are perfectly in complience. The violation comes when the user doesn't prevent his device from interferring with any service. It was idiotic of the Congress, and the FCC to allow that wording, but they did...and we didn't hold them to task for it.

Hello All,

There is a Collins Radio 51S-1 receiver in scrap condition
available on eBay right now. This chassis contains lots of useful
parts for Collins enthusiasts. In case anyone is interested, it is
item # 5824389211

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5824389211&rd=1&sspagename=STRK%3AMESE%
3AIT&rd=1

Thanks.

Nanu

I bet the eBay auction where you bought it said something like....

"I'm selling this for a friend and I don't know much about radios, but it
looks real nice except for a couple missing thingys. I didn't turn it on,
so I don't know if it works, but my friend said he thought it does...."

"They"? UPS never applied for any 220 MHz license nor do they
operate on 220 MHz, then or now.

The culprit was a certain "also-ran" equipment manufacturer who had
a bright idea (and whose CEO had "juice" with the FCC from whence he
came) but never could produce equipment that worked on that band.
They approached UPS to get them interested, but UPS got tired of
waiting for working equipment and looked elsewhere (800 MHz).

Gotta keep the urban legends straight!! <ggg>

I recently acquired a Viking Ranger in nice working condx.

I am interested in using this on AM on 160, 80, and 40 mtrs. The Ranger runs around 40 watts Am carrier output. I would like to get an amplifier to use with this xmtr, maybe a vintage amp. What should I be looking for? I would like to run legal Am Limit on these 3 bands. Should I forget about Vintage Amps and get a modern Amp? Suggestions please. Any pitfalls to using a modern Amp?

Thanx

Lazy Senior

Put the thing on the air as it is and have some fun.

You can add an amp if you want, but give it a try with 40W and see
how you do. I bet you'll be surprised.

There are plenty of decent used linear amps out there if you want to go
that route, but if you think about it in dB, 1000W isn't _that_ much
more than 10W. Only a few S-units at the receiver.

This is not as easy as it seems. AM peak power is
4 times the carrier. A 100% modulated 40 watt AM
signal is actually producing 160 watts PEP.
The linear amplifier could only be driven to about
25% output on an unmodulated carrier from an AM transmitter,
otherwise it would be severely overdriven on modulation peaks.
If you could drive a linear to 1000 watts, the maximum carrier
power for AM would require the drive to be set for about 250
watts max.

If you want more power you could drive a class C amplifier, and
apply high level modulation directly to it. Trying to "amplify" an
AM signal is very, very inefficient and difficult to set up properly.

Pete

Yes, I know it is not as easy as it seems, that is what I posted the message looking for suggestions.

I presently use a Viking Valiant putting out 140 Am carrier watts. It has worked very nicely.

Now also,I have a Viking Ranger, puts out 40 Am carrier watts. I want more power, especially on 160 mtrs.

Ok it is 1956 when these xmtrs were made. If I had a Ranger then, what would I buy for an amp?

I realize one problem I may have is 160 mtrs (a band I love) was restricted in 1956 and many radios, xmtrs, amps didnt have 160 mtrs.

So, I want to run 375 watts Am Legal limit with a Viking Ranger on 160,80,40 mtrs preferably with a Vintage Amp, but will consider modern amps.

What are my options - no homebrew..

thanx

Heathkit KL-1 Chippewa? Although that probably dates a few
years later, and may have been a "match" for the Apache.
The 4-400s could probably withstand the
duty cycle for AM operation. Besides the PEP issues, you have to
make sure the amp and its power supply will withstand AM
continuous carrier operation.

Most hams back then would have used the Ranger as an exciter
for a Class C amplifier deck with it's own high-level AM modulator.
That's the best way to do what you propose.

Hmmm....I probably have a notice here somewhere with your autograph :)

Does the FCC still go after Novices with 40m harmonics falling out of band on 10 meters or has the freeband CB QRM covered up all of the violations?

Just kidding. Well, no...not really.

You're right. I just check the documentation. I was fooled by the external
VFO having being digitial.

From now on, I'll have to tune it more slowly. :-) I was assuming the
100Hz jumps were inherent in the synthesizer and are only the display.

> The TR-5 came out after the TR-7 with the intent of being a poor man's TR-7.
> But, it was priced the same as the Japanese rigs with a synthesizer and many
> more bells and whistles.

Yes, I also have a TS-430s, which I think is around the same time. It has
AM send and receive (send may be DSRC, I don't remember), FM, more filter
options (TR-5 has one additional, TS-430 has one for SSB and one for CW),
8 memories, two "VFOs", etc. It also has a more sensitive receiver,
but it has a lot more noise.

Since the TR-5 had an external DIGITAL VFO, maybe you should "convert"
your TR-3 that way. THen you have the best of both worlds. A pto for
tuning in that wandering signal by hand, and a Digital VFO for memories,
more solid frequency control etc.

What??? 10W -> 1000W is 20db. Distance doubles every 6db - do the math...

> Only a few S-units at the receiver.

Talking about "S-units" in such a discussion is meaningless *unless* one has checked the calibration of one's meter - AND states the calibration characteristics to qualify the readings.

The reason is there is no "universal definition or standard" of "S units". There have been proposals - but so far no standards. The proposal that seemed to have had the best chance was made in the 40's - and that was where S9 = 50uv (at the antenna connector) - and each "S unit" down being -6db. As noted - that never became a standard - in fact today most modern receivers seem to be around 5db per S unit The reason seems to be that using -5db/S results in S0 below 50uv being right around the noise floor of most rigs - i.e. .2uv (S+N/N=10db).

But unless one states what specific characteristics of "S units" they are using - talking about "S units" is meaningless (i.e. a "few" "S units" could be 3db - they could be 18db - or more -- who knows if it's not stated).

Agreed , QRP can be very cool.

I am finding similar results with PSK and helshreiber on less than 50 watts
with regular European contacts.

And yes, you can make bunches of CW contacts with a single 6L6.

Ok, the Modern Amp seems to be the way to go with an old AM xmtr, mainly because they have 160 mtrs (THE band where higher power is almost necessary)and also I can call a 800 number and get one fast.

Which amp is best for my circumstance?

I have a Ranger running 40 watts AM for drive.I want legal limit AM or close to it with a modern Amp that can take it and not burn up because of the duty cycle. Suggestions under $2500 new price please.

Which amp tube would be best for AM - 572's - 811's - 3-500's or the high gain ceramic tubes?

Thanx

Lazy Senior

Lazy - Most modern amps being "linear" are not the way to go for AM as they have poorer efficiency than the older Class C amps with high level modulation. If you want an AM transmitter check out the ARRL handbooks and ham ads for the 1950 to 1970s when AM was king.

Higher power on 160 is nice as the band can be noisy and the higher power is needed to over come the noise level at the receiving end. BTW - a way around this is to limit the receive bandwidth as with CW or other slow speed forms of modulation and some most interesting work has been done with very low power levels.

A problem you will find with older AM gear is that the manufactures didn't support 160 meters years ago. The band had been taken over by the government's LORAN A service during WWII and partly given back to the hams with a 50 watt power lamination depending on where you lived. Most hams didn't attempt to use 160 and this limited store bought equipment.

If you have the room and technical ability might consider converting a salvaged AM broadcast transmitter. They are available as most stations are removing them to upgrade to much more efficient solid state units.

Good luck in your quest

Ok so I mixed db and dbi, point for you. Now tell me that 1000W is
"almost" indistinguishable at the recieving end from 10W - and S-units
are a valid comparison standard...

Sheeesh.

No, and I don't know where you got that.

Nobody used a linear amplifier for AM in amateur radio circles.
They either used medium power to start with, or went with a full kilowatt
amplifier with suitable modulator. They made sure they had the space,
and made sure the floor was strong enough.

If your transmitter isn't powerful enough for you, then you find a more
powerful AM transmitter. If that's still not enough, then you build
or buy a full power amplifier or transmitter.

You won't get much power out of a linear amplifier because of
the way things work.

Just because nobody makes a kilowatt AM transmitter these days, and
you aren't interested in building one, does not mean a linear amplifier
is "the way to go".

I won't tell you that they are almost indistinguishable. But I will say
that S-units should be a valid comparison standard, at least with military
gear that _is_ calibrated in 6 dB increments.

If you are only satisfied with the VERY best, then follow this link. This particular rig only runs 500 watts on 160, but that's because that was the legal 160 meter limit when the transmitter was sold. I am sure it would be easy to remove the artificial power constraint for 160 meters. Go for it!

I noticed some concern as to the possibility (let's not put it any stronger than that) of PCB's (polychlorinated biphenyls) being used in the oil filled capacitors of RCA AR88's. I have 2 such sets, one of which is weeping like a baby. I intend to replace the old capacitors with modern equivalents inside the old cans. Is it really likely to be PCB fluid? If so, how to safely drain, dispose and clean up the dripped fluid without wiping out much of Western Europe (or at least myself).

Bri

You must not work AM. I talk daily on AM (with my Valiant)and find hams
running linear amps at legal limit. They ALL sound good. Most are
driving the amp with old xmtrs....

Folks are doing that today, but in previous years it was much more common
to run the transmitter with no modulation, and run it into a (very nonlinear)
amplifier running the legal limit. Then you'd modulate the finals of the
outboard amplifier.

The good part about this is that your amplifier is now much smaller and
has lower input power than a linear amplifier that is truly linear. The
bad news is that now you need a modulation deck putting out half as
much AF power as your RF output, and a gargantuan transformer.

On virtually all of the mil receiver's I'm familiar with (or remember much about) the signal strength (carrier) meter is marked in dBs (not S units). I know that some of the "conversion sets" (like the RAOs) had S meters (though the meter was dropped after S/N200 of the RAO-6; and none of the RAO-7 had a meter). R-390s, 390As and 391s are all dBs; as were the 1051s.

Perhaps the newer ones (post 1980) have S-meters?

That's an interesting point - what military receivers --besides conversion sets -- have "S meters" (i.e. actually marked in S units)?

best regards...

There is great disparity between opinions on the toxicity of PCBs, from
'put it on your cornflakes' to 'satans death cum'. A lot of it comes
from the fact that there are lots of different kinds and that related
contaminants such as Dioxin are often present, and also from the fact
that a lot of the claimed toxicity can take decades to show itself (PCBs
and the like are very fat soluble and stable and just sit in your body
for years) as it takes the form of endocrine disruption. Its a minefield
of opinion, trod it in depth a couple of years back

Nope, know fuck all about transformers - ah, you mean audio output.
I've always assumed the same - match if possible, go over and you lose
volume but its ok and never go under or its boomboom or at least fryfry.

Yup - a Harris MW1 would be ideal... save for the power transformer(s) nearly everything else can be either hand made (coils, etc.) or bought off the shelf (transistors, etc.- including the PAs). The "output" unit consists of 13 identical RF modules twelve as PAs - one a driver. They "normally" run a 83W each - if one dies - the matching network effectively isolates it - the drive to the remaining PAs "steps up" - and it stays at a KW. One of easiest to maintain transmitters around (from both layout - and parts availability). PA B+ is (IIRC) something like 70V - the modulators consist of two sections - one that passes the 70V (i.e. saturated at 0% modulation) - or ramps down towards cutoff with negative modulation- the other section of the modulator is tied to +140V - and as positive modulation is applied - it overrides the 70V rail - and up it goes pulling the PAs with it. Capable of 110% positive modulation if everything is up to snuff. Each of those 13 identical PA modules includes it's modulator (both sections). Very efficient for an AM transmitter.

best regards...

Why would you want to replace the oil capacitors anyways?

They are still good. They have lasted 60 years and they will undoubtedly outlast us both.

Leave it for the next generation who will neither be able to read or write anyways.

The oil filled bathtub caps in surplus military gear are notorious for
being electrically leaky. Still a paper cap, regardless of the type
of oil.

Pete

Ya know... You specifically asked what type of "linears" would have
been use back when AM the common mode. Your question was
answered. Now your starting with the backtracking BS about
a modern "amplifier."

If you "know" people who are using linears with old
xmtrs", why not just ASK THEM WHAT THEY ARE
USING and quit trolling this newsgroup
with your BS?

The problem is a ham linear will not deliver 1000 watts carrier
power on AM. It would have to be rated for 4kW to do so.
PEP on AM is at least 4X carrier.

Pete

Hi,

No real pitfall with a modern amp, as long as you get one
rated for continuous duty a.m. operation.
You need tubes with a lot of plate dissipation rating,
since a.m. linear is inefficent, maybe 25% carrier efficiency.
Look for a linear with ceramic tubes, a big blower
and a heavy-duty power supply.

You may need an rf power attenuator between the Ranger
and the linear. Most modern linear amps
produce 1500W peak output with only about 65w peak drive.
Your Ranger will produce 160W pep output in a.m. mode
(at 40W carrier). The linear will be producing 375W carrier,
at legal limit, so it will be almost 10dB more output
than the barefoot Ranger. With no modulation,
the linear's power input will be about 1,500 Watts
(assuming 25% efficiency).
A lot of heat will be dissipted from the linear's plates,
about 1,125 Watts.

A T-network made of 3 each 100W lightbulbs may be an OK
rf attenuator at the linear's input, so you don't overdrive it.

The current power limit for AM is 1500 watts PEP. This
means a carrier output of 375 watts. Easily obtainable
with the proper linear amp.

I'll buy that. But, time and time again when on 40 meters SSB, as an example, and running 100 watts, when the receiving station tells me that he is having readability problems with my signal, then when I switch on the Drake L-4B, the user almost always reports a significant improvement in both received signal strength and readability. Going from 100 watts to 1000 watts is 10 dB. Going from 10 watts to 1000 watts would be even more dramatic.

I still regard the statement that a 20 dB increase in signal strength is "Not much at all" as pure Tier Scheiss.

You've missed a lot if you don't recognize his name and callsign.

He had quite a number of articles in QST, including a synthesized 2meter rig in the early seventies, when synthesizers were still a new thing in the ham magazines. Lots of VHF equipment too, and in Ham Radio magazine also.

Wrote for Communications Quarterly, and in recent years, has a column about antique radio in Popular Communications magazine.

He's hardly a "self-styled expert".

Why RT-718/FRC-93's, which are also know as KWM2A's do.

Don't those count as "conversions" - i.e. civilian sets "badged" with
military nomenclature?

I'll try asking again... what radios designed by / for the military (as
opposed to rebadged civilian sets) have carrier meters marked in S Units?

David - you've got a ton of mil stuff... what has meters in S units?

best regards...

I have a very nice REDMOND Model number 9107115 VAC 60 cycle double blower cooling fan for sale. It runs at 1570 RPM and should keep anything you can build nice and cool. My father-in-law bought it for an amplifier he was building but he passed away before completing it. I am asking $15.00 plus shipping for it. If interested please reply by e-mail. Photo available on request.

If interested please reply by e-mail. My address has been obscured to try to prevent spamming.

Hi Gang:

I have an excellent copy of the Instruction Book for the Collins 30L-1 amplifier that is surplus to my needs. It is the 2nd Edition dated 15 June 1961. It is an excellent copy with the full pull-out schematic, and hardly distinguishable from an original. I am asking $5.00 plus postage.

If interested please reply by e-mail. My address has been obscured to try to prevent spamming.

Only in America - would grown men using $1,000 computers pay $30 a month
for the priviledge of lecturing someone about the "best" way to use an
80 year old technology.

Lazy Senior: I feel your pain!

If I were you, I'd look for any of the "2KW PEP" linears that come up on
Ebay or at hamfests, such as an L-4B: any linear rated for 1KW key-down
continuous input will work fine. If you have the money, a Collins 30S-1
would be my "top shelf" choice. I recommend you avoid the "1KW PEP"
units, such as the Collins 30L-1, since they're designed for SSB.

If you are using coax, don't forget to check it for breakdown voltage
before loading up: AM peaks will put a lot of strain on older cable.
Don't ask me how I know ;-).

HTH.

Linear amplifiers are not new to radio. They were used in the thirties - yes to amplify am transmitters. It is old technology, and perfectly proper to put out a signal that way.

When you compare efficiencies of a linear amplifier to a full blown class C plate modulated amplifier, you must consider the filament and plate power of the modulator.

I worked a number of stations in the fifties that were running a low level transmitter into a linear amplifier, and they sounded excellent. The Central Electronics 100V and their linear amplifier put out an excellent AM signal. Even the KWS-1, which transmitted AM using only one sideband, sounded great.

The modern amp covers 160, though, along with the other bands, so of one is lazy (hence his name), the linear is a reasonable approach.

If you are going to couch the question that way, the answer is
none. Military sets have db meters. There are only a handfull
of general purpose receivers that would fit your requirement, and
most of those that you think of as purely military were also sold
to ham and civilian markets... granted, not as the primary market,
though.

The "S"-Meter is a ham invention. The "S1-9" part of the scale was an
attempt to quantize the "S" part of the R-S-T signal reporting system.
Where R is readability on a scale of 1-5, S is signal strength on a
scale of 1-9, and T is tone, on a scale of 1-9.

clean them up, with naptha, replace the lost oil (mineral oil is fine),
and replace the damaged rubber seals with a good quality silicone sealant,
and the capacitor will go another generation...assuming that it didn't
already arc over.

Oil capacitors have paper as part of the dielectric, but the paper isn't
where the characteristics of the capacitor come from, it is the oil.
The paper is just a convenient separator for the plates.

Thanx for the info. It seems like most hams I work on AM that use amps
are using linear amps, but much to my surprise there are many here in
this group that are against using linears.

This was in response to the previous discussion of the fact there is no standards for S unit meters (i.e. there are reports of S Units being anywhere from 1-6db/S unit - with 6db having been a proposed (but failed) standard - and 5db/S unit seeming to be common in modern (SSB) rigs.

Someone mentioned that military gear using "S meters" were calibrated to 6dB/S unit. I'm not familiar (in spite of being married to a boatanchor collector with a fair number of pieces of gear) with any "native" mil gear with S meters - which you pretty much confirm above.

Since that individual noted mil gear with calibrated S meters - I was exploring that question. As I noted - it wouldn't surprise me to learn that some modern (post 1980) mil gear has S meters...

Hence the "couched" question.

best regards...

4657. BC-221 as VFO ??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-01 15:48:03 UTC
From: William Mutch <wcm1@NOSPAM.cornell.edu>
Message-ID: <MPG.1dd158419dedb308989848@newsstand.cit.cornell.edu>
Source record: 15546

At last spring AWA meet I picked up a homebrew novice transmitter
of unknown provanence. It has a close resembleance to the one in the
1976 Handbook (except that it uses an electron coupled 12BY7 instead of
a 6DK7) and was built by a fine craftsman who did a first rate job on
it. The previous owner got it at an estate sale and didn't know who
built it.

Last weekend I got around to bringing it slowly up to working
voltage on a variac and tuning it into a dummy load with a variety of
Xtals. The 6146B final will deliver between 40 and 60 watts to the load
on 80, 40 and 20, but I had to stop testing before I got up to 15 meters
as my Tek 922 scope expired.
Since the rig will deliver power to both 40 and 20 I thought to
see if I can put it on 30 meters, but I haven't any Xtals which will
multiply into the band. I thought about using my BC-221 as a VFO.

Will the BC-221 provide enough volts out to stabilize the xtal
oscillator ??

What would be the best way to cable from the output of the BC-221
(some previous owner added a pl-259) to the xtal socket of the rig ??
It sees a 47K resistor to ground from the grid and is DC blocked by a
capacitor.

I need to assure myself that the BC-221 will not be damaged.

Has anyone ever done this ??

4658. Re: BC-221 as VFO ??

Its been many years since I've owned a BC-221, but I remember that
they were very harmonic 'rich'. Thats OK for a freq meter, not so
good for a VFO. Might be worth taking a look at before putting it on
the air.

I can't help you with specifics, but it was definitely done. I can picture
an article in CQ from the late fifties or early sixties that used a BC-221
as a VFO, though that might have been an SSB rig.

Old books would describe how to couple a VFO into a crystal socket. There
was often a coupling network right at the crystal socket.

Thanks for that Chuck.

However it still leaves the problem of potential PCB contamination: did they, or did they not use PCB's? If it is just mineral oil then there is no problem, I'll either refill, or more likely remove and replace with modern capacitors inside the can. It's the potential for PCB poisoning that concerns me most at the moment.

If it says SAFETY or PYRANOL on it, it's got PCBs. When PCBs were popular,
they were considered such a wonderful thing that manufacturers would brag
about them on the case as using SAFETY OIL.

PCBs are one of the most dangerous substances ever created. Oil-filled capacitors containing PCB were made as early as the 1930s. The AR88 was a wartime set, more likely than consumer radios to contain oil-filled capacitors.

There is no "safe level" of exposure to PCBs, and they do not break down in the environment. I would not risk cleaning out the old cans and putting new capacitors into them. Why not contact your local hazardous waste agency and find out how you can safely (and legally) dispose of the capacitors?

This web article -- I'm sure you can find many others -- gives some history about PCBs and their health effects.

Hi Phil.

Thanks for that, you highlight my dilemma well. I don't think many people realise that PCB's have been around for as long as they have. I only became aware of the possibility when I came across a query by P Bertini. The simple tests suggested by AndyB above look promising in this regard.

Hi. Can anyone please help me with schematics for the 1954, RCA AN/FRT502 VHF AM transmitter? I specifically need the power supply chassis and the audio modulator chassis info. Apparently these were used on the Canadian Pine Tree Line. I am trying to turn two of these swords into plowshares, home hi-fi audio amplifiers to be precise. They use a pair of 809 triodes in P-P to plate modulate a 832B.

Any assistance greatly appreciated.

Thanx Rob

It's a very interesting paper, it appears to have been written mostly
to scare, and to hopefully encourage one to become an environmental activist.

However, every single point you mention above about the dangers is counter to
what is actually said in the article: it does biodegrade, it takes fairly
large exposure to cause chloroacne, or liver problems...

Did you actually read the article?

Given the configuration you describe, I can't imagine anything short of a
lightning strike on the interconnecting cable, would cause harm to the vfo.

I am told that the real problem with PCBs is that they degrade into some
very hazardous things when burned. Although, of course, they don't burn
easily, which was the whole point of using them.

I used to wade knee-deep into tanks of the stuff, and slather it all over
transformer windings with bare hands. It turns out this is probably a bad
thing, but I haven't noticed any problems yet.

Check this website by EA5 amateur:

http://www.jvgavila.com/ar88_2.htm

He claimed the capacitors had PCB dielectric, something I've never
been able to confirm. A few other restorers have claimed that the
original metal capacitors were leaky enough to cause AGC and
other sensitivity problems on their AR-88x receivers. I haven't
worked on or restored mine as of yet, so I am neutral on the whole
issue.

I tackled PCB, Dioxin and Furan toxicity in some depth a while back (bear in mind there are orders of magnitude difference of alleged toxicity between these closely related and often co-present compounds/contaminants, and again in the different sub-types of the compounds, the levels of which can only be assessed with specialist testing) and what I found was that industry will tell you they are low-grade toxicity and cite a ton of scientific study and environmentalists will tell you they are the ultimate toxin and cite an equal amount of scientific study.

I certainly wouldn't disregard material just because its blatantly out to scaremonger. What about all the anti-tobacco ads telling you smoking gives you cancer - are they spinning BS just because they're out to scare you?

Acute poisoning (enough to cause chloracne for example) means taking on a *gargantuan* dose of these types of compounds compared with what is reckoned to be a 'tolerable daily intake' (TDI), and the levels that cause concern to professional health bodies like the World Health Organisation are vanishingly small (single figure picograms) and it is carcinogenic, teratogenic (birth defects) and immune disorders far down the line (even in future generations who inherit damaged genes) that they are worried about, not acute exposure toxicity.

Its difficult getting a decent professional opinion by looking at industry or environmentalist sourced material, as in my experience they are equally biased, but I think it is reasonable to accept the view of a body like the W.H.O, that class Dioxin like PCB's as potentially very dangerous substances (and known carcinogens) and impose such strict limits on human exposure.

My area of experience was with dealing with teensy-weensy amounts of this stuff. The difference in amounts from a waste incinerator (and diffused) per year and what is *potentially* contained in a few capacitors is like comparing a hand-grenade to a small nuke in terms of concentration and yield. They could contain millions of maximum permissible lifetime doses.

PCB's and the like do biodegrade but can take years to do so, all the while hanging around in your fatty tissues, doing whatever it is they are doing (or not doing, depending on your affiliations).

Even taking the middle ground between the industry view and environmentalist view, the *possible* risks would put me off touching the stuff or taking any risks with it at all, but thats my personal opinion.

If it's such harmless stuff, why has it been banned in the US since 1977?
http://www.epa.gov/opptintr/pcb/

To return to his original point -- why would you want to take a risk, if you can easily and cheaply avoid it?

If you're concerned about authentic appearance, there were postwar metal bathtub style capacitors which are actually paper caps, not oil filled. I found some in my Scott Labs 800B, for instance. Get a junker 800B chassis and scavenge the bathtub cases to restuff, if they look right and that suits you. You can also buy new or NOS style bathtub caps in a variety of values and case styles.

Alternatively, you can puncture the old case and drink what's inside, for all I care. It's a free country :-)

Go in peace,

Phil Nelson

Source record: 15566

1. You will not harm the vfo. Remember, they were used during a war.

2. There is not enough output from the BC-221 to drive the 12BY7 directly, and it is true that the harmonics are lively in it. So, you can build a tuned class A amplifier to build up the voltage, provide selectivity and also isolate the BC-221 from the rig to prevent frequency pulling.

I have used a number of BC-221/LM frequency meters into vfos, turned one into a regen receiver and presently have a solid state LM meter as a vfo in my Central Electronics 20A. It has a crystal controlled mixer for output on the different bands.

Sorry if I offended the tube purists with the last paragraph. The calibration book was lost and I got bored one night.

Well, something of a hornet's nest here - pleased you are all enjoying the debate.

My 'conclusion' thus far:

1) No one actually knows if the capacitors in question contain PCB's
2) If they do, they may or may not be hazardous even in small amounts

3) Therefore:

i) I will test the fluid as described in posts
ii) I will treat them as hazardous material in the meantime

Now where did I put my rubber suit?

There is a good reason D 104's were and still are so popular.

Microphones are like husbands and wives- they have to be compatitble. On the right radios (with high impedance mic inputs) they sound terrific.

I have tried many different mikes on my old AM transmitter and always come back to the D-104, with the Shure 444 a close second.

Your mention of the Central Electronics 20A brings back fond memories of my shack shortly after graduation from HS. I bought a brand new 20A from a store in Philadelphia's electronics row. I used a conversion kit sold by CE to create a VFO from a war surplus "command set". In addition to the 20A, I also bought a "signal slicer" kit from CE and used it with my Hammarlund HQ140X. Finally, my final was a pair of 100TH triodes http://www.uli.de/tubes/100th.htm running in grounded cathode mode. The final used a B&W plug-in link coupled tank coil. Yes, those were the good old days. I had as much fun with that equipment then, as I do now with my Ten-Tec Orion driving a Drake L-4B.

Bri,

The one part of the discussion that you should note, is that in industry, folks were literally bathing in the stuff, (occasionally) with no problem. We have several of those folks here on the group, and they have related their personal experience.

Every single person that handled carbon and mimeograph paper in the 1930's through 1970 came into contact with more PCB on each sheet than you will find in the leakage around your capacitors. PCB was used to keep the ink soft. Same with stamp pads, TTY ribbons, and single use carbon ribbons. I can vividly remember the smell of the stuff on those products. Did we have a rash (sic humour) of secretarial folks with chloroacne, and liver disease?

Other factory folks were exposed to it daily, ate lunch with hands that had it on them, smoked cigarettes from fingers covered with it, and drank from wells that were contaminated with the stuff, <<surprise!>> some of them showed some symptoms, such as chloroacne and liver difficulties.

Still other folks got exposed unintentionally, through food made in mills that accidentally leaked the stuff into the food, and wells that were contaminated by extreme factory dumping, or ate fish from rivers that were subject to millions of gallons of factory dumping, and they too showed symptoms.

If you take reasonable precautions to keep the stuff off of your skin, and out of your mouth, you will not be harmed. Even if you don't, at those small amounts, it is very doubtful that you will ever show any symptoms.

Now as to disposal: The last time I brought that subject up with the hazardous chemical group at our local landfill, they were quoting something like $100 for a single motor run capacitor (that may, or may not have contained PCB).

Better to sell your old caps to the audio/guitar guys on ebay ;-)

> Lazy (yes) Senior (yes)

Well, you can go either way, but linears are simpler, self-contained, easy to service, and they help keep the room warm.

High level plate modulation was "The way to go" before the FCC switched to measuring output power instead of input, and I understand why some hams would want to use Class C finals and high level modulation, since that's the best way to get the most efficiency out of a 1 KW input rig. Now that we measure output power, I don't feel that the added hardware and maintenance of using high-level modulation is justified. Others may disagree.

My attitude is "If it isn't fun, stop doing it" - this is a _hobby_, but somehow a few hams never get the word. If having a "big iron" rig is what turns you on, go for it. If you want to maximize efficiency and homebrew a rig from scratch, there are Class E designs available using computer components to good effect. If you're interested in a smaller footprint and interoperability with SSB or other modes that need linears, then a linear is a practical alternative.

FWIW.

Thats a bit like the "My grandad smoked 80 a day all his life and lived to a 101" chestnut. Is this proof that smoking doesn't give you cancer or that the cancer statistics are wrong?

Personal experience or anecdotal evidence means very little when dealing with long term toxicity (unless the illness is specifically associated with a given exposure, like asbestos and mesothilioma). It is medical statistics of a large, controled group that shed any truth to a matter such as this. Unfortunately, these are hard to come by because of the long term nature of PCB toxicity in a society literally bathed in chemical contaminants and highly mobile.

Even closely monitored exposures, like the Seveso incident in Italy are inconclusive (I once spoke to the head of toxicology for the UKs Chemical Response Unit who reckoned that no-one found any ill effect from that incident, but she was defending a hazardous waste site at the time.)

'Symptoms' are a sign of acute poisoning, obviously to be avoided, but the health authorities of EVERY developed country would consider someone with levels of PCBs in thier bodies millions of times less than that needed to cause 'symptoms' as being over the limit of reccomended exposure and at possible risk.

Having been exposed to whopping doses doesn't mean you will be comparitively more ill than someone with a lot less inside them in the long term - the mechanisims of toxicity of PCBs are not the same as mercury or arsenic, where the more you have, the sicker you are. The

endocrine system of the body works with tiny amounts of hormones and messenger chemicals, and its having these messed with that is the real worry (especially in developing children), and we DO know that PCB's and the like do just this.

For instance, there is a disorder of the womb that is rampant today (can't remember the name right now) that was extremely rare before the invention of PCB's. There can never be a 'smoking gun' leading to the prescence of all pervasive PCB's in the environment as being the cause of this (for a number of reasons), but it is EXACTLY the type of illness predicted to be caused by long term PCB body burden and endocrine disruption.

The World Health Organisation place a TDI of 1-4 picograms (a picogram being a *trillionth* of a gram) on Dioxin-like PCB's. That is an incredibly small amount Chuck, and when dealing with large amounts of this stuff (meaning any visible amount) you could easily get comparitively huge doses inside you without noticing, and you can't in all honesty state with confidence that 'you will not be harmed' by these amounts. Nobody knows for sure, but there is certainly enough evidence and (non-hysterical) concern around to be more than cautious.

> posters here inferred it was not a reasonable approach.
> Lazy Senior

I use low-level modulation and a linear amplifier to work AM. My advice in selecting a linear amplifier for that mode is to focus on the heat dissipation capability of the final devices, be they tubes or transistors. Although the theoretical efficiency of a class-B amplifier is something like 67%, that applies to a signal swinging the amplifier between cutoff and saturation. For the carrier-wave level, which will be 1/4 the peak output power, the operating point will be in the regions of the characteristic curves that are much less efficient. I typically get 25-30% from my SB-220 with a 250-watt carrier output power. Worst-casing a desired 375-watt carrier level with 25% efficiency gives a final-power-dissipation requirement of 1125 watts - a stretch for a pair of 3-500's, somewhat easier with a 3CX1200 and easier still with an 8877/3CX1500. The steady-state power-supply requirements are also pretty strenuous - 1500 watts - although most recent designs (Ameritron AL-1500) are capable of this.

The efficiency argument against using a linear and in favor of high-level modulation is seen to be fairly strong. However there are a few additional factors to consider: As noted by another poster, the modulator has to be powered up and has its own efficiency issues. Also, using a linear amplifier rather than a Class-C final reduces the harmonic-attenuation problem considerably (as well as neighborhood TVI complaints). Modulation done at low levels is more "controllable" with modestly sized components for splatter filters, negative-peak loading/clipping and negative feedback. I use an SSB transceiver (a Kenwood TS-850) for the extreme form of this "modulation control", since my transmit signal is passed through the same 6 kHz IF filter used for reception - effectively filtering out splatter and out-of-channel IMD. The last advantage of linear amplifier use, stated in the beginning of this thread, is, of course, the ready availability of commercial units, both new and used. For a dual-mode station (AM and SSB), the investment in the amplifier pays a double dividend while, at the same time, breathing new life into (and a whopping signal out of) many cherished vintage low-power AM transmitters.

The Shure 444 has a controlled magnetic element.My manual says it is high impedance for high mic inputs. The 444D had an impedance switch on the bottom for high or low the 444 does not.

I have both D-104 and Shure 444 and have tested them a lot on a Valiant which has the audio mods. Most people prefer the sound of the D-104, but the Shure is a close second.

> or that the cancer statistics are wrong?

Smoking and cancer are a funny (as in peculiar) example to pull out as a comparison to PCB exposure. First, the anti smoking groups pretend that no one ever got lung cancer without smoking. The truth is more like as many people get it with smoking as get it without. The cancer connection is difficult. The heart disease and emphasema associations are much easier to prove... and I am not now, nor have I ever been a smoker.

Second, smoking is a great act of self deception. People who smoke go out of their way to become heavily exposed to tobacco smoke. It doesn't seem to me that it would be all that common for people to intentionally ingest PCB's.

Being in the presence of PCB is not the same as being exposed to PCB, or ingesting PCB.

There a couple of ways of looking at that. The one I tend towards is the connection can't be found because it doesn't actually exist for such small levels of exposure.

> Even closely monitored exposures, like the Seveso incident in Italy are
> inconclusive (I once spoke to the head of toxicology for the UKs
> Chemical Response Unit who reckoned that no-one found any ill effect

Again, this is probably because the connection doesn't exist for small
levels of exposure.

...

>
> The World Health Organisation place a TDI of 1-4 picograms (a picogram
> being a *trillionth* of a gram) on Dioxin-like PCB's.

Dioxin and PCB's aren't the same thing. The WHO TDI is a limit for *ingested*
amounts of PCB on a *continual* (eg. daily) basis, not an extremely
infrequent, accidental skin exposure to a very small quantity (such as might
happen if one touches a leaky PCB coated capacitor). You cannot legitimately
infer that because PCB has a 1-4 picogram TDI, that occasional skin
exposure to a 1-4 picogram sample is harmful.

No one is suggesting that the PCB be intentionally ingested over a long term.
And no one is suggesting that you make a habit of exposing yourself to PCB.

We are all going to die of something. And yet with all of our exposure to
toxic chemical coctails, heavy metals, and radiation, quality of life, and
life expectancy continues to rise...(even accounting for the extreme lack
of childhood deaths due to the success of vaccines on the usual childhood
diseases.)

Reasoned caution is good, but hysteria isn't all that useful in cases like
this.

-Chuck

I wasn't directly relating PCB exposure to smoking, just the practice of citing anecdotal evidence like 'it never did me/him any harm' as anything meaningful or to suggest that something isn't harmful. Your quote on lung cancer levels being the same with/without smoking is crap though - where did you get THAT from, the Marlboro good health guide?

I know Dioxins and PCB's are not the same, but they are often present together - as I said, only specialist testing will tell you the actual I-TEQ (overall dioxin-like toxicity) of anything PCB-like.

>> You cannot legitimately
>>infer that because PCB has a 1-4 picogram TDI, that occasional skin
>>exposure to a 1-4 picogram sample is harmful.

I wasn't infering that at all, but the amounts involved in even the slightest contact with *actual* PCB fluid (such as getting enough on you to actually see, say a fingertip smear) would involve amounts millions (possibly billions) of times greater than levels we are exposed to in the environment. Lots of studies show that PCBs are rapidly absorbed into the skin, so its quite possible to absorb doses that would equal a lifetimes normal exposure just by touching a 'leaky PCB coated capacitor' with bare hands.

>Being in the presence of PCB is not the same as being exposed to PCB, >or ingesting PCB.

Wasn't aware I said it was, though you shouldn't discount dust vectors.

>>Reasoned caution is good, but hysteria isn't all that useful in cases like this.

If you look at what I'm saying and compare it to the typical environmentalist view you'll find its a million miles away from being hysterical. Most environmentalists would class my current views as downright evil.
I won't say what they'd call you.

What about you Chuck - I'm interested to know where your views on the subject come from. Have you physically worked a lot with PCB's or come from a healthcare/medical background? Done lab work with hazardous chemicals? Why do you trust one view (not very dangerous) over the other (very dangerous). Just hate tree huggers?

> N9NEO
>
Bob

I know they are industry standard numbers, and I have drawers
full of them in the cellar someplace. If you do a Google search
you can probably find the original specs.

NTE crosses the CER73 to a 1000 volt 1-amp diode,
and the CER70 to a 600 volt 1 amp diode. (NTE 125 and
NTE 116 respectively.) If it were my TX, I'd go with 1N4007
diodes, or even something with a bit more current rating.

If you want originals, I could dig in my parts bins, but that
might take a while :)

I am an EE. I know rather a lot of folks that have spent rather
a lot of time up to their armpits in PCB laden transformer oils.
They did this back when everyone *knew* the stuff was harmless.
It probably isn't quite as harmless as we thought, but it certainly
isn't the cause of instant death and dismemberment that the enviro's
say it is. As far as I can tell, none of the people I know who
were exposed was harmed. No cases of chloroacne, and all of their
kids look and perform normally. Anecdotal, to be sure, but it is
what I have observed. If the stuff was as bad as the enviro's say
it is, there should be a very significant number of problems in the
folks in the electrical professions... and an even greater problem
in the older hams. We all have been exposed. Where are these problems?
EE's seem to be making it to the normal ages before dying.... so do
hams (in spite of their smoking...)

I have seen the hysterical reactions that environmentalists have had
to quite a number of substances that the research shows to be fairly
harmless. I don't trust people like that. Everything is a little
good, and a little bad. They see things completely black and white
with no shades of grey.

Hate tree huggers? No, I own a staggeringly large number of trees.
I hate people that create terror in an attempt to gain political
power. The anti DDT, anti nuke, anti Freon, anti lead, anti mercury,
anti gun, anti any chemical man knows how to make group fits this
pattern.

William
We think alike. Too many hams take hamradio way too seriously. Its not a way of life, its just a small part of my life.

I am a long time ham -45 yrs-. After posting here for the first time I was called a troll simply because I asked a stupid question which I didnt know the answer to. Altho having been a ham for so long, I am not particularly tech inclined.In other words my life doesnt revolve around electronics and theory.I know fom experience many hams look down on those who are only Tech lites or Generals. It is no surprise young people dont want to join our ranks.

You were one of many who gave me a very informative answer in language I could understand. I only wish more had your attitude.

Thanx and hope to CU on AM

Thanks Pete,

I am thinking the 4007 parts would be good myself. I was gonna stick one in each half wave, but after hearing the CER73 part is 1kv, I'll go with two in series. I got some MUR1100 parts here but I've had problems with fast diodes snapping themselves into oblivion.

TX is back on the shelf till I get some more parts.

regards,
Bob

Yea, I'm begining to think the 450v caps probably would have worked. I have been living in the solid state world far too long. I stuck a nice pair of 220uf / 400v caps in each can. Should have at least 1600v worth of cap. I did wrap a little bit of tape around the whole mess before I into can so I will cross my fingers.

regards,
Bob

Again, thanks for your helpful words. I have not found anything wrong yet except for a bad solder on V1. I won't get into everything that I did, but the tubes are good, C56 is good, I can't find any other bad components, and for sure its the main VFO that is being affected. I tuned it in on another rx. The freq shift is small, maybe 50 cycles at its worst, but thats enough to be a problem. I tried other values for C56 and find that the shift is less with less C and larger with more C. There is a slight voltage variation of about 1/2 volt on the screen of V3 that can be detected when a strong signal is present, and a change of a couple hundredths of a volt on the cathode. I think next I will remove C56 entirely and see if the VFO is still shifting. Will let you know what happens! Thanks.......T

I also dislike hysterical rhetoric for political or monetary gain, but it cuts both ways. I've found that the worst evironmentalists are no more hysterical than industry PR is in reverse (completely playing down dangers of its products or byproducts).

>> I hate people that create terror in an attempt to gain political power. The anti DDT, anti nuke, anti Freon, anti lead, anti mercury, anti gun, anti any chemical man knows how to make group fits this pattern.

I'm sensing a lot of hate there Chuck - maybe you should go and hug your trees ;)

Do I take it that you also think DDT, nukes, lead, mercury and guns are not as bad as most people make out or are 'fairly harmless'?

The "I hate people" in the above statement is really a bad figure of speech. It probably should be something more along the lines of "I am truly disappointed when"...

I love my trees, but I don't worship them. When you have only one or two trees, you tend to think they are each special, after a few acres of trees, they start to become distinct only in groups, or clusters, after the first dozen acres, they start to become a blurred mass, and after the first 100 acres it is a little hard to get too personally connected to any individual tree...sometimes it is a little hard to even find an individual tree more than once...at 200 acres, well, that's a heck of a lot of trees...

While you think I am some kind of environmental devil, in actuality, through the careful management of the acreage I own, I do more for the environment than any 1000 people.

> Do I take it that you also think DDT, nukes, lead, mercury and guns are
> not as bad as most people make out or are 'fairly harmless'?

Most anything can be harmful when it is misused, or improperly disposed. It is long past time to include the full price of disposal of a product in the retail cost of the product. If one was to do that, plastics would be too expensive to use.

Mercury is a terrifically useful element. Without it, fluorescent and compact fluorescent lamps (the fair haired child of the enviro movement) would be non existent. Would that be a good, or a bad thing?

Lead brought us the only hybrid and electric cars yet on the road. Without lead, they would be unaffordable. Without lead, you would still have to hand crank your car to start it. Would that be a good, or a bad thing?

Guns save more lives, in the US, each year than they cost... by a factor of more than 100 to 1. Is that a good thing, or a bad thing?

The banning of DDT was the political entry point of the international environmental movement. It was the political brain child of Ruckleshaus. He banned DDT in spite of science that did not support his conclusions, and in spite of his own EPA committee's recommendation *NOT* to do so. The fix was in. It has been said that the US ban on DDT has amounted to genocide in third world countries. The blunt instrument used? Mosquitoes. The victim? Children.

US Nuclear power plants have a safety record that is unmatched by any other form of power generation... yet thanks to the enviro's, you cannot commission a new nuke plant in the US. You cannot even upgrade an old nuke plant in the US. The current generation of nuke plant only extracts a small portion of the available energy from the fuel rods. Yet thanks to the enviros, you cannot reprocess the spent fuel rods to extract the rest of the power. You cannot even remove the "spent" fuel rods from the reactor facility for storage in a better protected location.

Coal fired plants have killed thousands from air pollution and plant accidents, and yet they are just ducky... Well, except for that global warming thing. I know, wood fired power plants!

I am very fond of the environment. Probably much more so than you. I long ago put my money where my mouth is. I am not at all fond of those that call themselves environmentalists.

My contribution to this thread has long since past the point of being a reasonable side tracking. This is my last posting on this subject... for now.

Well since you're bailing I feel safe in agreeing with you because I neither want to belabour an argument in whats good can be bad or vice versa.

But...

I worked a while in NE Oklahoma. Asbestos mines, lead mines. Pretty much under the radar of the environmentalists who seem to need someplace snazzier than Picher, Oklahoma to drive home their point.

I found the local conditions appalling. Maybe because I was constantly reminded about don't drink the water...or inferences that "hell, thats the way those crazy Okies are". I worked in direct contact with people and it seemed as though EVERYBODY had a mentally defective family member hidden away in a back room and there was certainly no shortage of borderline cases outside and on the street. Anybody from outside would notice it.

I'm 100% against the Kerry-camp type of "sky is falling" kneejerk reaction to anything that isn't mountain spring water (imported from France) so I'm not speaking from that context.

It would seem to me, an eternal Devil's Advocate, that there are indeed issues with 'public level toxicity' that get totally overshadowed by both extreme camps. The guy that puts on a hazmat suit to work on his boatanchor or the politician that claims that they are producing honey if the industry benefits his district. Both come off as fanatics deflecting concern from the real world aspects.

So yeah, these scenarios really do exist but not because an old radio is leaking fluids. If you want to save the earth you can start by saving Picher, Oklahoma and forget about the miniscule implications of your weenie little capacitors.

4708. HCRA Auction - Feeding Hills, MA, November 4th

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-03 13:12:46 UTC
From: "Jim, KK1W" <kk1w@charter.net>
Message-ID: <E1oaf.55630$RG4.53959@fe05.lga>
Source record: 15497

Just one day until the auction. We have just received the following donation for sale tomorrow evening:

Through the generosity of Dan Beaudry HCRA has obtained his dad's HF/VHF equipment as a donation for sale at tomorrow night's auction. Jim Beaudry, K1GIU, joined the ranks of the 'silent keys' in 1999. The electrons in his equipment have been waiting since then to be set free! I will do a quick check on the equipment before bringing it to the auction. Check out the list below, it represents a great opportunity to get on the air at bargain basement prices. All proceeds benefit your club so don't be shy with your bidding.

DONATION FROM K1GIU

Icom IC-706 - Mobile HF/VHF/UHF 100W Transceiver w/mic
Icom IC-3200 - Mobile VHF/UHF Dual band transceiver w/mic
Icom IC-751A - Base HF transceiver
Dentron GLA-1000 HF Amplifier - missing fan and tubes
MFJ Versatuner V - 3KW HF roller inductor tuner
VoComm power amplifier

TOY DRIVE!

HCRA is asking all auction attendees to help the ARRL and the Salvation Army with their Toy Drive for 2005. If you're able, please bring an unwrapped toy with you to the auction. We will gather them together and bring them to the ARRL for distribution to displaced children from the Gulf hurricanes. Thanks in advance and don't forget to attach your QSL card to your donation.

Now on to the auction...

The annual HCRA auction returns again with our usual fun and bargain extravganza! Come to Feeding Hills, MA on Friday, November 4th and enjoy a great amateur radio auction. This yearly event draws over 100 people from at least three states. It's a great place to sell your old stuff or go home with a bargain. Win a Yaesu VX-7R in the raffle too!

Only a week away - have you got your stuff ready??

The particulars:

Date: November 4th, 2005
Time: Set-up at 6:30 PM, auction starts at 7:00 PM
Place: Feeding Hills Congregational Church
23 North Westfield Street
Feeding Hills, MA 01030
Admission: Free!!!!

Here's a link to a Google interactive map:
http://maps.google.com/maps?q=21+North+Westfield+Street,+Feeding+Hills,+MA&spn=0.043945,0.079338&hl=en

The simple rules:

Sellers: Mark your item with your name, call (if you have one) and a minimum selling price (if you so desire). 10% of the sale goes to HCRA (maximum is $10). Amateur radio or computer items only. Please box small items into lots for quick auctioning. If it doesn't sell you bring it home.

Buyers: Bid, buy and go home with a bargain!

The tradition of a great raffle prize continues. Purchase a raffle ticket to win a Yaesu VX-7R Handy Talkie. Also second and third prizes of an ARRL Antenna Book and a 25A power supply.

Coffee, donuts and softdrinks will be available. Everyone is welcome, bring a friend or two along for the fun.

For further information please drop me an email or call. All contact details are on our web site at: http://www.hcra.org.

'73...

4709. FS: Transmitting Type Tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-03 15:16:34 UTC
From: Jim McShane <jimmcshane@prodigy.net>
Message-ID: <mRpaf.6060$Kv.3254@newssvr22.news.prodigy.net>
Source record: 15498
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I have accumulated a few transmitting types that
are really unfamiliar to me, as I specialize in audio
and guitar tubes. Rather than just let them sit, I'd
like to find them a good home. Most are JAN or
FAA designated, all are USA made.

I've priced them at about 1/2 of what the typical price
was that I could find on the web. I can't test most of
them, but all are guaranteed not to be D.O.A., or I'll
refund the price.

Here's the list - it's the quantity, then the tube number,
followed by the "web" price (mostly from RES or RF
Parts), then the selling price:

Qty. Type Web Price My
Price ea.

1 2K25 $25.00
$13.00

1 3E29 (829A) $14.00 $7.00

2 3B25 (new) $20.00 $10.00

2 3B25 (used?) $20.00 $6.00

3 4D21/4-125A $95.00 $50.00

1 5D21 $42.00
$21.00

1 705A $10.00
$5.00

3 815 $15.00
$8.00

1 826 $35.00
$18.00

2 829B $14.00
$7.00

2 832A $7.00
$4.00

1 8122 (used?) $225.00 $75.00

Drop me a note if you can use any of these tubes.
Thanks so much!

Jim McShane

I find that I have about 40 type 813 tubes "in stock". All these tubes are either removed from unused equipment or from used surplus gear. The only rig I have that uses them is my ART-13A transmitter and I'll never use these extras in my lifetime plus 100 years! Each and every tube has been tested in my ART-13 transmitter and compared with a new tube at the 120 watt output level. Each tube was at least as good as the NIB JAN tube. I'm asking $10 (which is exactly what I paid) a piece and actual cost for postage. I also have a plethora of 1625's for $8 each.
Tnx de K3HVG

Hello!

I'm interested in the new unused 813s. How many
do you have on hand?

Let me know if you would.

Many thanks,

Jim McShane

Hello Again Thermo-man and everyone else. Well your on the right track.

> There is a slight voltage variation of about 1/2 volt on the screen of V3 that can be detected when a strong signal is present, and a change of a couple hundredths of a volt on the cathode.

There should be no voltage changes. Oscillators are very fragile things - doesn't take much to get an amp to oscillate but keeping it on an exact freq is an art. Most military receivers have buffer amps after various oscillators to keep things steady. This is why they have so many tubes ! Any little change will affect frequency. SOMETHING is causing this voltage change. What could it be ??

> I tried other values for C56 and find that the shift is less with less C and larger with more C.

Big clue! What your doing is adjusting the amount of coupling from the VFO RF into the cathode circuit of V3A mixer tube. Well DUH!

But what most folks forget is that a cap is a two way RF door. Part of the Main sig is coming back to the VFO the other way...

It travels down to the Colpitts circuit of C59 and C61 (both 1000 puff). The idea is to attenuate the main sig to ground (C61) while coupling the VFO RF to C56. If C59 or C61 values have changed then the main sig will couple into the VFO tube Cathode circuit (V3B) and cause all sorts of problems. It could also couple into the control grid -and- VFO LC circuit if C58 has changed value (100 puff). You can also check resistors R34 and R32 but I really don't think that's the problem.

>I think next I will remove C56 entirely and see if the VFO is still shifting.

This will prove that it's not a power supply problem. Your not coupled to anything so the VFO should not shift frequency.

NOW FOR SOME FUN...

You can couple the VFO to other parts of the Mixer tube. Heath has it coupled to the Cathode of V3A but you don't have to have it that way....

What happens if you run a wire from C56 and plug it into the Plate ? Well since an equal number of electrons are emitted from the Cathode as they are arriving at the Plate - I would expect no change in VFO performance/problem.

What happens if you run a wire from C56 and plug it into the Grid Leak circuit (Pin 3 6EA8 V3A)? Now your more isolated from the main sig but your VFO drive level is too high! You can compensate by using less cap in C56.

What happens if you run a wire from C56 and plug it into the Control Grid circuit (Pin 2 6EA8 V3A)? Now your VFO is mixed with the main sig but at a much lower level. Again, your VFO drive level is too high! You can compensate by using less cap in C56. T2 bandpass limits the amount of VFO passing back up to the V2A Het Mixer. The main sig level is too low to bother the VFO unlike the Cathode injection point. This might be a good alternative solution to your VFO problem.

So now your can change the VFO mixer level.

What if you could adjust the BFO and 1st HET oscillator levels too ? Well you would have one heck of a receiver customized for present band conditions, DX or local QSO's and even individual tubes! Lets face it - all factory circuits are a compromise of performance, tube values and conditions and operator likes and dislikes.

Actually this is a pretty good idea for a project if you don't mind butching up a set. And since you can find 16's for $25 to $50 bucks you wouldn't be out by much if you blew it up.... hmmm when's the next hamfest???

Technically, an "LLC" is a modified form of a partnership. In a traditional
partnership, *each* owner is responsible for _all_ the liabilities of the
business. In an LLC, 'n-1' (at *most*) of the partners are 'limited liability'
partners -- they have liability exposure only up to the assets they have
invested in the company (subject to 'special case' situations like those
mentioned above, whereby they may incur additional liabilities). The
remaining partner (or partners) is a "general partner", and is personally

liable for any/all things above and beyond the assets provided by the "limited" partners.

A full fledged "Corporation" is a 'legal person' in and of itself. Assets of the shareholders (the owners of the corporation) are immune from claims against the corporation. Officers and directors of the corporation may have personal liability to the shareholders for acts as a corporation official. Persons acting "on behalf of" the corporation may end up with personal liability for their own actions or conduct, IN ADDITION TO the corporation's liabilities for those actions/conduct.

An LLC is much simpler -- in terms of organizational structure -- than a full-fledged corporation, But it gives the 'limited' members "almost all" of the protections of a passive stockholder in a corporation.

Basically, it is an attempt to give the 'small guy' most of the benefits of the real corporation, without burdening him with all the overhead that is necessary for a large business entity -- WHILE, at the same time, ensuring that there _is_ a "responsible party" to fall back on, in the event of claims against the business.

From a customer standpoint, there is essentially "no difference" between dealing with an LLC, and dealing with a full-blown corporation.

That was me.

>Since that individual noted mil gear with calibrated S meters - I was
>exploring that question. As I noted - it wouldn't surprise me to learn
>that some modern (post 1980) mil gear has S meters...

For a while (post 1980) they appeared on some of the gear that was intended
for use by relatively untrained operators, but for the most part it wasn't
widespread. Mostly because gear that was intended for skilled users (and
I put the R-390 in that category) may as well use the more accurate dB
metering, and gear that was intended for unskilled users pretty much didn't
have metering at all (like most field radios).

>Hence the "couched" question.

There is a 6 dB mil standard for the things, and I'll dig it up because
I have it somewhere in my office. The fact that it doesn't get used much
if at all is quite true, though.

I had a feeling there might be a few "latter day" examples of mil S-meters - but, yes I quite agree - the few BA receivers I'm familiar with that have meters (390 series, WWR-2, etc.) are dB while the vast majority of BA receivers don't have any signal strength meter at all (ARC 5, 348, 654, and so on).

> There is a 6 dB mil standard for the things, and I'll dig it up because
> I have it somewhere in my office. The fact that it doesn't get used much

That's what I'm interested in - I did a quick (very quick) scan through several of the manuals I have here (Navy Electronics Tech 3 & 2 parts 1 & 2; Basic Electronics; EIMB Reference Data, EIMB Communications (incomplete); EIMB TM&P)- and while just about every manner of dB is covered- I didn't spot a single mention of S-Units. I must note, however - they are from my time in the Navy - which was the 1970s- and that's why I have allowed that S-units may have come into common use in the military in sometime since 1980.

best regards...

And of course, the transformer is likely the most expensive item
in the power supply. Either it is good, as you say, or one has
to reconsider. Any of the other power supply parts will be cheap
and likely easy to get, but a transformer is going to be costly.

VERY UNUSUAL for a transformer failure on an Astron supply.
How did you check this??

IF you are new at troubleshooting Astron supplies, look here for almost
everything you need to troubleshoot (KBT DC Supplies):
http://www.kbt-dc-supplies.com/index.php

I use a standard Fluke DVM for all Astron repairs (check bridge rectifiers,
diodes, pass transistors, voltage / current measures.

Standard components to fail on Astron:

LM723 - no simple way to test (NEVER remove or install without draining the
large bean can electrolytic capacitor -- or you will destroy it internally)

Bridge rectifier
MOV on across primary of transformer
NPN Pass Transistors (2N2055 or 2N3771) on heat sinks
Sometimes SCR (Crow Bar circuit)

Broken Astrons are a "gold mine" since they are straight forward to repair!!

Aint nothing wrong with my antennas. I use a 75mtr loop at 60 ft for 75 and 40 mtrs. its fed with open feeders. A 160 mtr L with 24 radials, and a beam at 50 ft for 20-10 mtrs. I also live on a high hill......

I have a solidstate linear which I use with my modern equiptment. Aint nothing wrong with higher power. If 40 watts carrier is good, 375 watts is really good. :>

I just recapped my newly purchased Viking Ranger. It now works great. It doesnt have the PTT mod. My manual has the instructions to do the mod but it requires a Potter Brumfield LM 11 10,000 ohm relay. This relay is no longer made and I havent been able to find a suitable replacement for it.

My thought is to use a 12 volt relay with maybe a small 12v supply built-in to the Ranger or maybe a 12v wall wart.

Has anyone done this PTT without using the LM11 relay? Maybe there is a better, easier way to add PTT. I dont want to re-invent the wheel.

Thanx

Lazy Senior

Send a message (or call on phone) to Dee Almquist, W4PNT.
Dee does excellent Ranger restorations -- and can advise you of the relay
and modification approach that he performs.

Here is his web site
http://w4pnt.8k.com/

Source record: 15530

I just aquired a Drake TR4c.

It's my first "boatanchor" rig... and am still getting use to it.

Question;

In CW, the the Sideband switch must be on the "X" side to TX.... But as I cycle thru the bands, some (80,15,10m)are on the wrong sideband (as shown by the indicator light).

Is this a problem? The manual says the freq is shifted during CW TX but does the Drake TX on the normal (upper above 40m) sidebands
Or does it shift to the sideband as indicated on by the light??
Which would make it wrong on the above listed bands.

thanks in advance

4743. Variable Regulated Tube Power Supplies.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-05 19:02:04 UTC
From: novatech@eskimo.com
Message-ID: <dkivjc$83n$1@eskinews.eskimo.com>
Source record: 15532
Cross-posted to: rec.antiques.radio+phono,rec.audio.tubes,rec.radio.amateur.boatanchors

Over the past few weeks, I have seen postings requesting schematics for variable tube supplies. I finally took a few minutes to scan in a couple from the GE Essential Characteristics Book from 1969, and to convert a hand-drawn schematic to .pdf.

I doubt that these schematics are definitive, but I built two of them and they work on my bench. The GE 1-compactron supply also exists as a totally solid-state version as a dedicated BC-312 supply (MosFet as pass element and a MPSA42 as the gain stage).

I put the schematics, along with a brief explanation, up on:

http://novatech-instr.com/Fun/ge_ps.pdf

I am pretty sure the last schematic violates the specs for a 12GB3, but it seems to be working.

Comments are welcomed.

Steve.

Hello Steve,

Thanks for the interesting PS links. I'm not sure of their HT current capabilities. I've been wanting to make a good bench HT, Fil, & Bias supply, for a while now. I have a few ham radio PS that don't quite make it.. The major drawback is that the Xfrs are only capable of 100ma. At times I could use a little more that 400ma. Hopefully, someone reading this thread will come up with a viable suggestion.

Cordially,
west

This sounds interesting and maybe easier than the 10,000 ohm relay route. And drawbacks to using the filament power?

Lazy Senior

The sideband concept is only meaningful for SSB. Convention is to use LSB on 80 and 40, and USB on 20, 15 and 10.

On CW you transmit just a plain carrier that has no sidebands. Therefore noone can determine which filter you use when transmitting CW. In principle you could use either of the two filters without fear of infringing any convention. But the TR-4 requires that, on CW, you always use the same filter (that marked X). That filter, on SSB, is for the upper sideband on certain bands or for lower sideband on other bands. But this matters only when you work SSB. For CW you put the switch to X and forget.

Hi

re: Your question on the Drake TR-4 in c.w. mode,
you should always keep the switch in the "x" sideband
position for c.w. In the "x" position, during c.w. or a.m. transmit,
the 9mc BFO crystal frequency will be shifted into the passband
of the "x" SSB filter, to reduce carrier loss through the filter.

On some bands, in c.w. mode, you will be listening on USB,
and other bands you will be listening on LSB,
as indicated by the red indicator lights. Thus, you talk about
the "x" filter instead of USB or LSB filter, because
the "x" filter will be for USB on some bands and LSB
on other bands.

The "upper" or "lower" light varies with the band switch
for the same reason that the frequency dial calibrations
read +lower+ on some bands
when you advance the dial clockwise.

The reason for this behavior is that Drake used either a sum
of two frequencies or a difference of two frequencies
to generate a third frequency, depending on the band.

The sideband filters are near 9mc,
the VFO runs between 4.9 and 5.5mc.

This was done for economy:
The sum and the difference will put you on 80m or 20m
without any other mixers needed.
(single conversion design on 80 and 20m).

73,
Ed Knobloch

The best high current PS I have seen uses the same topology as the GE
1-compactron one but uses several 6080 (6AS7) in parallel. I have an
old transformer I am saving for that kind of thing that puts out
650Vct at 850mA. I have a TV transformer that is 550 at 250mA, but it is
being saved also. That's alot of iron.

The basic block will work for any load, just get enough current handling.

Good luck.

Steve.

If you are willing to use transistors in your variable supply, along
with a fan and a big heatsink, it is quite easy to get 400mA up to
about 350V. For example, Hammond makes the 378CX, which is rated for
465mA of DC. You then use mosfets, which can easily handle the current
if you keep them cool. The B+ part of this schematic,

http://novatech-instr.com/PDF_files/ps_ss.pdf,

for example, is an exact copy of the GE 1-compactron PS, but done with
solid-state parts. Obviously, a lot of scaling needs to be done
(MPSA42 is only good to 300V). This particular one was done for 90v.

If you design it to cover 50-350 at 400mA, then you are going to burn
120watts worst case. That will require a fan, big heatsink and
several paralleled Fets, but it will work just fine.

I wasn't interested in spending that much on parts.

Steve

6080s are good for this. I used to have a regulated supply from an old
Ampex VR-1000 (2" reel-to-reel VTR) that delivered 250V at 6.5A.

At the end of the day, the transformer is goung to be the biggest (and
certainly the heaviest and most expensive) single component.

Quality does not come cheap.

Chris.

For a single secondary transformer of considerable size it's often cheaper to have the local transformer winder to do one as a one-off. I have had transformers in the 1500 VA class wound for me cheaper than Peter Dahl listed them as shelf stock. Winding your own is also possible.

Many surplus sources exist if you scrounge around as well.

For many years, I worked at John Fluke Mfg. which had a transformer
prototype model shop. For the 20 years I worked there, I never store
bought a transformer, instead using the prototype shop after hours.

At Novatech, I can wind small devices, but not the big iron stuff.

Hurricane to me references the Hallicrafters SR-2000 Hurricane.

Possibly one of the CB radio sites.
That was the market for that gear in 1970s.

Tubes designs of that era are large sweep tubes (no longer inexpensive)
Identify the tube -- and that narrows the possible amplifier designs

Bi-polar solid-state designs were largely copies from Motorola application
notes (Helge Granberg) - without credit or royalties paid to Motorola.
You will find MRF (Motorola) or 2SC (Toshiba or other Japanese mfg)
transistors.

I'm not sure that wording is fair.

By definition, application notes are done by a semiconductor manufacturer
to sell the devices. They aren't selling design, they are selling the
transistors or ICs. If an application note sells more devices, then
it's a success. Note that in many cases for ICs, there is a fairly fixed
means of using the IC, which was seen by the manufacturer from the start.
If they didn't show you how the IC was intended to be used, then the IC
isn't of much use.

If semiconductor manufacturers were expecting credit and/or royalties,
they'd either not be giving out the application notes.

Well Helge is not here to defend himself -- he passed away at his home in
Phoenix, Arizona, January 16, 1996. He was 63

Motorola is just down the road from where I live (an influence for my
career).
In the 1970s Motorola did have PC board layouts as part of their application
notes.
Today, you can legally purchase PC boards from some of these original
Motorola application notes from CCI.
http://www.communication-concepts.com/

I understand your point and I am talking about today's IC design work.
At this time (early 1970s), all of Helge's work was ground breaking
(patents) for RF amplifier transistors & proper applications.
The issue was concerning usage of Motorola's application notes -- it
included trademark infringement - where the law is very specific.

When I was doing part-time work during college (1970s), a mobile solid-state
amplifiers began to appear for the CB service.

A few of these landed on my bench from the owner --- with a note "see what is wrong with it". (One rattled due to the exploded core of the output transformer !)
Many of these the PC board maker failed to remove Motorola's name and trademark (on the original PC artwork in the notes) from the boards!
BTW, Intel would keep a board copier in courts for decades -- if this happen today with their motherboards.

It is my understanding that Motorola received a number of calls (consumer complaints, etc.) about these -- but it was not their manufacturing!
Legal and marketing departments get quite upset about these issues.

Although I never saw an official Motorola statement from that period -- many of these clones/copies quickly disappeared in mid to late 1970s
The Palomar/Boomer/"made in my Texas backyard" amplifier designs are the ones copied these days (without bias).

Hi, looking for some of the small aluminum project-box style panel meter cases that have the sloped fronts to fit the small/med meters using a 2-2.5 inch hole. These are the style made by Bud, etc, and were either a grayish or bare aluminum finish. I have some AC volt and amp meters to mount. Thanks in advance, dave austerman, N5WNM, Oklahoma, daveaust@pol.net

Sadly, most of those were hot chassis.

However, a very interesting device is the microwave oven transformer.
110V in, 1KV out, varying from half a kilowatt to a kilowatt. The
transformer core is split so you can easily take turns off to lower the
secondary voltage, too.

After checking out the patent no. 1626391, I misread the number previously.
It was patent in 1927 so I guess it was for TRF receivers, giving them a
wider tuning range and perhaps a neater dial cal. Does anyone recall who
might have used them?
tnx

There was an article in Antique Radio Classified some years ago that made me aware of capacitors with tapered plates.

You can look up that patent online www.uspto.gov, click on search under patents, click on patent number search, put in the number, and when it tells you click on images. You have to have a tiff viewer plugin in your web browser to read them. That particular patent seems to apply to a capacitor with flat plates, so perhaps there was a pending patent on the tapered plates.

A variable capacitor with semicircular plates and the axis of rotation going through the middle and flat plates gives of course a linear relationship between capacitance and angular rotation. By altering the plate shape a bit and moving the axis of rotation off-center you can get a capacitor that tunes straight-line wavelength. Wavelength is proportional to the square root of capacitance. In the early days of radio wavelength was often specified instead of frequency.

You can make a variable capacitor that is straight-line frequency, which rotation has to be proportional to the reciprocal of the square root of capacitance. With flat plates this requires a fairly radical plate shape, with the axis of rotation very far off center. As a result there has to be a lot of empty space for those long narrow plates to swing around. I'll post a picture of one of these to that binaries group.

So a way to get around the odd plate shape and the space it occupies is to use plates of tapered thickness. It would be nice if you got straight-line something, but even if you don't you have something where the stations are more spread out than they are with straight line capacitance.

I have an old TRF receiver of the vintage of multiple knobs and 01A tubes that uses capacitors like this.

I just acquired a Mars Thunderbird Mobile Tansmitter that uses a pari of 6AQ5 tubes and a 12AU7. The 12AU7 is the oscillator/Amp and one of the 6AQ5's is the PA. The other 6AQ5 is the AM modulator. This is a very nice Japanese made radio from the early 60's designed for mobile use.

It looks like it is all there but I need a schematic to get in on the air again after all these years, especially the pin out of the connector on the back for the power supply and control.

If you happen to have one of these nice little radios I sure could use some information from you.

Well, you have 2 different animals listed. The FS-4 is a "solid state adjustable "crystal"" accessory for the drake c line. Basic functional testing could be done with a freq counter and scope. The best test would be to plug it into a drake receiver and look at freq stability and noise by tuning a known signal.

The FR-4 was a digital frequency display upgrade / plug-in built be Etek for the drake c-line. This is basically a frequency counter with offset to match the drake and packaged to complement the drake c lines. Inject a frequency and compare input to displayed frequency for accuracy and stability.

Still the best test is to plug it into a drake c transmitter or receiver.
Have fun-Don

I don't know the whereabouts of any but do remember them in the Air Force MARS stations in the Viet Nam Era. As a communications officer, one of my additional duties was directing the MARS station. I was told that USAF originally purchased them for SAC and they never performed up to the Collins standards, so they were phased out and put to use in the MARS stations and ROTC. We had a lot of trouble with them there too and eventually were able to get some KWM2-As.

Hallicrafter, Telefunken, Nordmende, etc all used similar caps in their TRF recievers, as did ARC5,ARC 7, and quite a few of the communication transcievers used in the late 30's early 40's. I had operational ARC 5 and ARC 7 with the external Antenna Tuning box in the late 50's. Made nice QRP devices excepting the QRM generated.

Thanks for the information but unfortunately my library of QST goes back to 1990 only, will have to ask around to see if anyone has that but as I recall QST did not publish any schematics usually.

It depends. If the rig was simple enough, they might. And it was
pretty normal for them to show snippets of the schematic, because there
was something different about that bit of the circuit, and they wanted to
talk about it. It's only in recent years that they dropped the any schematics
from the reviews.

Given the description, I can't imagine the rig being particularly unusual.
Look in old handbooks to find rigs with that tube arrangement, and you've
got something close, which can be used to visualize the rig and use
as a start for tracing the schematic or troubleshooting.

Hi, Steve

You're right, the QST article has no schematic.
I just thought the review would be interesting reading for you.

The rig requires 6 or 12V for the heaters,
and 250VDC for the plate supply.
The 6AQ5 modulator is designed for a carbon mic.

Well, it's a mystery. There is no manufacturer's name on it anywhere. And
all the parts are from various well-known parts vendors (except no labels
on the coils). There are several theories:
Might be a home-built set - if so, it's incredibly well done, including
an engraved front panel
Might be built from a kit - but then you'd think the kit manufacturer
would have put a name on it somewhere.
Might be a factory-built set for some department-store chain that was
to attach their own brand label, tho there is no evidence that one
ever was attached.
Might be a factory-built set and the maker is deliberately non-identified
to avoid paying royalties on the Neutrodyne patents. Which could also
apply to a kit. I read some early superhets were sold as kits to get
around paying patent royalties.
Someone suggested a fly-by-night manufacturer, who would come into a
village with a wagon load of receivers, and secretly bring another
wagon with a transmitter. The transmitter would assure they had a
good signal while they were selling the receivers; and once they were
all sold they could move on. However this receiver is certainly not
shoddily constructed.

Any other theories?

The dials are not calibrated in frequency or wavelength. They look like
National vernier dials, calibrated 0-100.

Both great microphones. You can find Shure 444 and 444D microphones
surplus -- it was a very popular model for Public Address (PA) usage in a
variety of applications.

Free tower, rotator, and antenna in Pampa, Texas. The tower is a heavy duty, windmill type self supporting tower with a large base that tapers off to a small top section. There are 4 sections. It is around 40 feet tall. I believe that the antenna is a Mosley CL-33 triband beam, and the rotator is a Ham IV. There is also a 2 meter antenna on the very top, above the beam. and some extras like an antenna tuner and swr mete. I am posting this for an estate of a fellow ham. The tower and antennas will have to be taken down, which will require some effort and skill. If interested, e-mail me for more info. Thanks, Charlie Hugg, K5MBX

4805. SX130 Restoration..some parts required and manual

Just thought Id throw this out..maybe someone has a top cabinet or a junker sx130 gathering dust somewhere. I just inherited from my uncle an sx130..in fairly clean condition but missing top cover and some of the tubes. The tubes/manual ect should be easy to get from the internet sales folks..but the top cover..that might be a devil. Also missing is the back. Im thinking maybe the back was a 1/4 inch type fiberboard type of back..I could maybe make something.
I may even try to make a top cover in a metal shop.
I live in Elliot Lake Ontario ..about 2 hrs drive east of Sault Ste Marie Michigan. Also I frequent Ottawa ontario from time to time.
ve3ab@rac.ca PS..can anyone tell me if the SX130 was a decent reciever.

Source record: 15396

I am really starting to enjoy my Boatanchors which have only been in my shack for about 6 weeks.

I have a Viking Valiant and Ranger. I am thinking I would like to have a scope with a trapazoidal pattern so I can watch my modulation like all you old pros. I have never done this before and need a little direction from those of you who do use a scope.

First what kinda scope should I get? Is one of those station monitors scopes the way to go or should I use an oscilliscope.

I own a 5mhz basic B&K #1405 oscilliscope that works. I use AM on 160mtr - 40 mtrs only. Do I need a better scope?

Ok can someone tell me or direct me on how to hook things up to get a trapazoidal pattern?

I am not a real technical type ham, altho this BA stuff has me learning way more than I used to know about electronics. Keep it as simple as you can.

Thanx

Lazy Senior

4809. FS Heathkit SB-101

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-12 00:30:29 UTC
From: gil <gi1pi@yahoo.com>
Message-ID: <1131755429.775243.162960@g49g2000cwa.googlegroups.com>
Source record: 15398

SB-101 in good shape, full output and very sensitive receiver, I have
been using it on 80m,40m and 20m CW, all tubes check good and 3 new
pulleys.

Im asking $120. shipped or offer?

For more details please drop me an email. Im also good in qrz.com

Thanks...Gil N2WJW

>TIA,

>steve

It is base diagram 6AM, which means any number of big horizontal output
tubes like 6BQ6, 6CU6, etc.

I was looking at the schematic for a Fluke 407. They did a smart thing. When
they paralleled tubes for more power, they series the filament, so that if
one burned out, the output went off rather than burning up the next tube.

Steve.

Earl,
The SX 130 had a one piece cabinet, not a flat top cover like the SX 122. It never came with a back cover. The tubes should be easy to obtain. You might try Antique Electronic Supply in Ariz. (They have a website). If you are handy in the metal shop and have the metal bending tools, you might try to fashion a cabinet and attach some rubber feet. Every so often a parts unit comes up on the online auction site.
The SX 130 is a nice mid price range receiver for short wave listening and can receive AM, CW, and SSB broadcasts. Mike KF6KXG

well, if you had more than one transmitter, you could simply act as a
repeater and boost the signal on as many stations as you had transmitters.

but i just dont see it actually happening. sounds crazy.

Ah come on guys/gals -- it was a legitimate question
Unlike the political and other trash that appears on the NG's

I think his answer will be found at URL:
Nice article on using an Oscilloscope in the Ham Shack
http://www.icycolors.com/nu9n/scope_your_audio.html

Includes trapezoidal patterns

Which indeed can be found by using Google -- but one might get a bizillion
hits

So if you know where the info is -- why not give a URL ??

Give a man a fish and he will back the next day (or several times a day) for
another

Teach a man to fish and he will be seen in a boat every day with a six pack
o beer -- fishin by golly

Indeed use Google but if you need further help DIS IS DA PLACE

That is why it was set up

4821. Ft. Wayne Hamfest Items

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-12 18:28:28 UTC
From: Henry Kolesnik <kolesnik@sbcglobal.net>
Message-ID: <gvqdf.16331$q%.1428@newssvr12.news.prodigy.com>
Source record: 15411
Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.shortwave

Weather permitting I'll be going from Tulsa, OK to the Ft. Wayne Ind.
hamfest on Nov. 18 & 19 as I've got to reduce my ham gear collection. I
plan on bringing as many heavy items that I can get in the car because I
don't want to eBay them as they're too much trouble to pack. I'll bring
whatever I can that generates interest via this email. I'd like to rent a
van but that's $150.00 more expense and I figure it'll cost me $500 to go!
Most of the stuff has been in storage for about 10 years and most of it
worked when put up. I haven't priced the stuff yet but I want to get as
much as I can reasonably close to going market price, so I can get my
expenses back. If I can't I'll bring it back and eBay the stuff.
Here's what I have:
Several Collins 75A-1, 75A-2, 75A-3 and 75A-4.
A heavily moded 75A-4,
A 30L-1, and 30S-1 but the 30S will take too much space.
And a couple of R-390A and 651S-1
Drake L4B, L7, L75.
Hammurlund HQ-170 I have 2, one has a clock, HQ-180 with clock
Heathkit HL-2200, SB 220, SB-200, SS-9000
Hallicrafters SX-28, SX-62, HT-33B, R45/ARR-7 I have several 28s
Gonset 3323
Swan linears Mark I, Mark II and 6B
National NC-183D, NC-303, NC-400.
Since I'm not getting a van I'll bring only 8 to 10 and try to maximze my
cash.
I plan to drive up in 2 days leaving Tulsa Nov. 17 and going via
Springfield, MO, St. Louis, Indianapolis and Ft. Wayne and could meet
anywhere along the way.
Let me know.
tnx

Where is this "Ham Spirit" we all are supposed to have. Why does everyone just has to act like an asshole on Usenet? I asked a simple question, but only got got trash talking. I know how to google and read books, I was asking those that do use scopes how they do it.

No wonder No one wants to became a new ham any more, we are all cranky bastards with a chip on our shoulder.

Why even have this boatanchor group if you cant ask simple questions and get help and not riduculed...

I am outta this group right now, you guys just go on reading the auction ads, thats all this group is good for..

Lazy Senior

Any most basic of silly 'scopes may be used to display a trapazoidal pattern for monitoring AM modulation. Especially if it has provisions for direct connections to the vertical and horizontal deflection plates of the crt and you're monitoring 160 and 40 meters.

RF to the vertical and Audio to the horizontal.

That link someone just sent may explain everything.

If you have more questions, just re-post.

What it is with people who come here with an attitude, using a name
that in effect sets the stage, "lazy senior", and seem not very good
at asking questions, yet when they don't like the responses, they
think the medium is at fault.

YOu get interested in something, you read up on it. Then you ask
the questions from the standpoint of having some sort of common basis
with the people you are asking questions. A year before I was licensed,
I had a basic idea of how oscilliscopes were used for modulation monitoring,
and had an idea of what was commonly used. It was in the ARRL Handbook,
and there was a time when virtually every ham would have had a copy, it
being common ground.

So then you would know the basics, and if you couldn't grasp some of what
was said, then you could come here and say "I read up on oscilliscopes
for modulation monitoring in the Handbook, but I still don't get why
they connect directly to the deflection plates, rather than feeding
it through the input on a commercial scope?".

That question defines some of the issues, and ultimately it is a couple of
hints to you, hinting that the answer was in at least the old Handbooks,
hinting that the answer you seek.

If you didn't have such contempt for the medium, this is the second time
you've turned around after coming to us with your questions and said you
don't like the medium, you might grasp that far more than a comment
on your laziness, my bit about books was against the notion that the

internet would be the final point of all information. It can be
really useful for obscure bits of information that might not travel
well because of limited appeal, but books and magazines with their more
formal style are often the best place for learning. People who think
they can have all the answers without going near books are fools.

I would suggest there is something in the tone of your posts that causes
the responses. But telling someone to read up on what you are interested
in is not some "usenet" thing. Decades ago, people likely were directed
to the Handbook for many an answer, because it had already been written.
When I was a kid and newly licensed, the most important thing anyone
told me was to keep reading all that I could get my hands on, and the
most important thing was that they lent or gave me back issues of
the ham magazines, and old books, so I could read and learn.

Ask an interesting question, you are more likely to get a good response.
Remember, people aren't paid to answer your questions here, so you have
to give them reason to want to. Your "lazy senior" is a bad start,
asking general questions that could best be answered by reading would
be an issue too. And maybe, it's your attitude that you think you
know the answer, but then want others to give you that same thought.

When you asked about amplifiers, a little dip into the old books would
tell you nobody used a linear in the days of AM. People told you that,
people gave reasons why, but then you turned around and basically ignoring
what was written, said "yeah, but what about linear amplifiers". In effect,
what we took the time to write didn't matter to you, because you "knew"
the answer was a linear amplifier. You can't learn anything if you
don't listen to what people are saying.

If you don't like my responses, you'd better be looking at yourself, because
I've had access to the newsgroups since 1994, and it sure isn't so I can
"ridicule" people. I'll go out of my way to write something if I feel
the poster is worthy of the effort, but sometimes the truth is
indeed that they should be reading books or even doing websearches.

Actually I got VERY good responses on the amplifier questions with lots
of private emails that were very helpfull but NOTHING helpfull from you.

And I got the right answers concerning my Ranger and PTT post but
NOTHING helpfull from you.

I have got nothing from you except your attempt to ridicule and flame
me. If you dont have anything to contribute just keep your thoughts to
yourself, no one here wants to read them.

I have had access to newsgroups to way before you, does this make me
smarter - hardly.

Seems like all you do is go outta your way to ridicule or flame people.
Thanks for your call letters, I'll make sure I ignore you on the air.......

I don't know, but I tried jumping a different value resistor at this
circuit thereby greatly changing the voltage on the screen and there was no
freq shift.

Removing C56 absolutely clears up the freq shifting alright.

So I can't find anything wrong, its just bad design and it needs a buffer. I live pretty close to W1AW and it is the main source of this rigs' problem. None of my other rigs are bothered by strong signals except maybe for the old S-38. So I built up a little source follower circuit with a MPF-102 on a terminal strip, played with circuit values a bit and it stops the freq shift just fine, BUT the output of the follower is too low. The mixer does not give full output. So I guess I build an amp for that circuit, or maybe put a tube cathode follower in there or throw the radio out the window.....the saga continues.....

Hi Group,
I have a nice Viking Valiant I that I just do not have the time to get into. It is fairly clean with some minor scratches under the meter. I fired it up and it put out around 100 watts so some new caps and maybe a set of finals would be in order. The wiring looks clean. The cabinet looks like a repaint but good. I am asking $425 which is what I paid for it including a copy of the manual. I did pick up a pair of 3B28's for it but never got that far.
This guy is too big to ship but if you are seriously interested, I can bring it to the Ft. Wayne hamfest next weekend. Otherwise, within a reasonable drive of the Chicago NW suburbs.

I agree with Lazy Senior on all points. Black offered absolutely
nothing to the thread except frustration. If you can't offer info then
don't reply. If you want answers, you need to get on moderated
forums. They are just as free as usenet. As a matter of fact, some
ISP's don't offer very good usenet access so you have to pay extra to
get a good usenet provider. I don't ever ask questions on usenet

anymore. I do follow some of the threads because I do see good info
from time to time.

Thanks Ed for letting me know the plate voltage. I have been using it with a Heath PS23 and using the low voltage feed and as it turns out it is 250vdc but it is good to veryify that was the designed B+.

I have looked through a quite a few handbooks and a Google search but no luck finding anything like this yet. So will keep pluging.

It does have a few problems......1.) The tuned output from the buffer does not respond on 80 meters like it should. I can not get the coil to resonate like it should on 80 but it works fine on 40......2.) The antenna loading tuning capacitor has no effect at all...just like it is not there or something but it is wired in and not shorted...So this has me stumped...The plate loading cap works but when rotating it I get a peak in the power output but no dip in the plate current...How can this be???

I did find a bad tube socket in the oscillator (12AU7) and have replaced that now and it doesn't get intermmitant any more so there is some progress. Any ideas from anyone as to why the Antenna Load Control has no effect and how I can get a peak in power output with a dip in the plate current??

Two Western Electric command sets: one transmitter and one receiver: one NIB, the other just NOS (someone took the box at the estate sale before I could get to it). Both in super condition-never used-have been in storage. What a chance to get a pair together in such fine condition. + pse take a look the other item as well--tnx for looking..heytubeguy:

I have a Hallicrafters R-47 Speaker with the Red "h" for sale. It is in very nice shape and sounds good too. Price is $65 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

They've been there for years, I didn't realize they were still going.
Not only is it a wholesalers dumping ground, its also a dumping ground
for sellers who have been thrown off of ebay for various infractions.

Hi

If you're getting output without a good plate dip,
it may be that the rig is taking off at a parasitic frequency.
(outside the range of the grid or plate tank circuits).
Is the "peak" in power output kind of "twitchy"?
(Meaning that a slight change in plate tuning makes for a big
change in rf output, which shouldn't be the case on 80 or 40m).
This could be another sign of a spur,
like the final either oscillates or doesn't oscillate
depending on the setting of the tuning capacitor.

I doubt that the simple rig has a neutralization circuit,
so the final depends on getting drive at the correct frequency
to avoid taking off.

Have you a grid dipper to check the tank circuits?

Another thing to check is on the tuning/loading capacitors -
there is a spring metal wiper that is fixed to the frame
of the variable capacitor and touches the shaft of the rotor.
The wiper may need a drop of electronics cleaner
to break loose some debris and make a good contact
with the shaft.

Regards,
Ed

Ebay is and is going to remain the "800 pound gorilla"
of online commerce. Yahoo auctions are a very bad joke.
A better name for their auctions would be "Ya-who,"
since they catch all the "trailer park" sellers.

I read several of these posts, and the responses. Its not just this newsgroup, but also on lots of technical newsgroups. There are a lot of people (mostly younger, but a lot of older ones) that think: i) NGs are a source of _free_ advice, and ii) you not only can come up with any question, but the _lazy-easy_ way to do anything is preferred over doing any research via, say, google (we've all forgotten all the other search engines, haven't we?) and heaven forbid that anyone should read books any more. I read the ARRL handbooks and lots of electronics books, magazines, all the old catalogs (Allied, Newark, Lafayette, etc.) when they first came out. Grand stuff!

I get upset when kids come onto a newsgroup and say "my teacher gave us this assignment to do a term paper on (subject X) and use the internet to do it and where can I get that term paper already done?" And that's the way the internet is being used.

What is wrong with doing some broad reading and thinking, first? Then formulate a purposeful question.

My FT 101e has never worked with a mic (works good on CW) since I got
it a while back, took it appart today only to find the wiring to the
mic jack has been messed around with (not sure why) and I also think
there should be a cap between the hot mic wire and ground, after trying
different vaues I tried .01 uf and with an amplified D-104 it seems to
work good,
is that the proper value?
where does the hot and ground get connected?
and....would the FT-101e work better with a lo-Z or hi-Z mic?

I would appreciate the help...thanks, Gil n2wjw

Hello All,
I picked up a really nice working Swan 350 at a hamfest this past weekend. I bought it for nostalgic reasons as it was the kind of rig my dad bought for me in 1965. I need info on how to fix the infamous "Swan drift problem". Anyone have any websites I can go to get mods for this rig including the drift fix?
Any help will be appreciated!

The drift "problem" how long after turning it on does it keep drifting?
My Swan and Heathkits drift for the first 30-45 minutes after that they
are solid.

There is a Yahoo Swan group you might want to check out and join, lots
of good people in there that can help you out.

Good luck, 73 Gil

First you call me a troll and then a lid. I didnt call anyone names.

Here's a thought, if you dont like the person, or question,or answers
dont flame or call names, just dont respond. Keep you thoughts to
yourself. Is that so hard? It isnt for people without egos.....

I agree. I shipped a 25 pound package to Rome Italy via USPS and the cost was only $42.00. I was told that it would go air and be delivered within 5 days. Had confirmation from recipient in Rome in 4 days!

Easy! Everyone seems to forget this.... ok first if yours is a 350 or 350A
then the VFO compartment is at the bottom of the rig. Flip it over and
remove the bottom cover. If yours is a 350B, 350C and I think 350D's too the
VFO compartment is on the top. Remove the top cover.

Now everybody cleans all sections of the bandswitch with De-Oxit right ?

But look beside the vfo compartment right next to the bandswitch. See that
little metal cam arm connected from the bandswitch and goes into the VFO?

Thats RIGHT! It connects to a secondary switch wafer -inside- the VFO and
guess what - no one EVER cleans that switch! The wafer gets dirty/corroded
and its part of the VFO LC circuit! Look at the vfo schematic.

...so guess what happens when poor LC switch contacts get hot.... duh....

These wafers are supposed to be self wiping but I have seen them solid black
in color. One even had some green gunk growing on it ???

So De-Ox that sucker and your problems will most likely drift away.... :^)

FYI -the Swan 250, 260, 270, 400, 500, and 700 all had the same VFO cam
switch as well.

4871. Wire antenna analysis software recommendations?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-16 03:17:40 UTC
From: Smokey <telegrapher@hotmail.com>
Message-ID: <11nl9829qsmnb4@corp.supernews.com>
Source record: 15359

Am looking for recommendations of antenna analysis software programs to assist me in development and construction of a variety of wire and multi-band antennas. Primarily interested in programs that display radiation pattern. No preference if it is old DOS based or the latest thing. I would prefer shareware/free or at least something reasonable in cost. Thanks.

Well folks,
The original buyer for the Valiant had to back out. This is a nice clean unit with the exception of some scratches under the meter which should be relatively easy to touch up. I did fire it up and it puts out a little over 100 watts so a set of finals is probably in order as well as some recapping. The cabinet looks like a good repaint. The underside looks good with no mods that I can detect at first glance. I am asking $425 with a copy of the manual. Since it is so heavy I think local pick or meeting within a reasonable distance of the NW Chicago suburbs is in order. I will also be going to the Ft. Wayne hamfest this weekend. I do have pictures and there is one on QTH.com.

If you decide to ship this puppy, remember that EFJ crated it for
shipment. I speak with some unfortunate experience that Valiants don't
take the ride well... at all! The VFO reduction drive and coupling will
be ruined and the iron will rip loose. Double boxing does not seem to do
the job... it really does require a stout crate. Maybe one of those
industrial-strength, multi-layer boxes with hard-foam corner panels
might work??? Too bad no more "Railway Express"... if anyone remembers!!!

When I purchased a Viking 6N2 Kilowatt, I had the seller remove the HV
transformer and choke and box them separately. I don't think it's wise
to try and ship anything with the heavy iron in place nowadays.

And, I don't mind a few questions but when the pattern starts to take the form of "I want eveyone else to continuously spoon feed me and tutor me, and with quality that I choose, and at the rate I choose, and for free" yeah, I start to get tired, too.

My first recommendation to you is to find something else besides "Lazy"
for the first name of your alias.

Second, you, right now, are doing the things you are recommending that
otehr people don't do.

Third, how about cracking some books, old QST magazines, etc., and learn
a few things on your own. Then when you next propose a question, you can
tell people you actually spent some time looking and finding not enough
answers. Don't forget to tell people what answers you did find AND why you
thought they were inadequat. Otherwise, you sound like that kid that gets
on the NGs and says "My teacher gave us this assignment to use the
internet to write a term paper on X and could someone send me a copy of
the report on X?"

You get my drift, don't you?

FYI....

As a general opinion, I, too, would shudder to think about shipping a Valiant by commercial methods. However, let me also hasten to add my personal experience with having a EFJ Thunderbolt (even heavier than a Valiant by maybe 30 lbs?) shipped from the NE to me in North Carolina a couple decades ago. The guy shipped the two 4-400s in a separate box, left all the other tubes be in their sockets. How done? Greyhound bus! I never thought about that until the guy brought it up. He had the Thunderbolt very well surrounded by a bubble wrap and inside a tripple layer corrugated cardboard box (like commercial grade), and it arrived just fine. No tinkle from broken parts. Played very well (after I put the finals back in). It was a bear to drag it up 3 flights of stairs, though, and the box was like a full cubic yard in size!

But, commercial buses have large cargo space in a compartment under the seats, accessible from the outside. Shipper takes box to bus terminal, box gets ride (maybe a transfer? or no transfer if non-stop, but no football stuff) and they call you to pick it up when it arives, you drive down and look at the package before you accept it.

Again, FWIW. And, I think even UPS plays a little football with stuff. Bus might be much better. Unless you want to hire a courier.

Yeh Greypuppy does a great job of shipping , on time, and with a minimum
of damage-- their prices (were) reasonable- tho havn't used them for
quite a while-- but-- reminds me about a cross word puzzle from 30
years ago in 73 Magazine - looked for "The weight of a BC-610" thought
looking for the actual weight - and a 4 digit Number! Actually the
solution they wanted was " A TON"! as info, jim nn7k

4908. UPS Rate Increase

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-19 02:02:19 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <437E877D.7060200@ix.netcom.com>
Source record: 15297
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

...Since you are a UPS customer, we want to give you advance notice of new UPS rates that will take effect January 2, 2006. You can click here by December 12, 2005 to request a reminder e-mail when the new rates go into effect and the 2006 UPS Rate and Service Guide is available on ups.comï¿½.

UPS published On-Demand Rates* will change as follows: Commercial Ground will increase 3.9%, and UPS Air and International Services will increase 5.5%....Adjustments will be made to accessorial charges in 2006. The residential surcharge for UPS Ground will increase by $0.25. The residential surcharge for UPS Air Services and UPS 3 Day SelectSM will increase by $0.35. The Additional Handling charge and the charge for Collect on Delivery (C.O.D.) service will increase by $1 per package. UPS Delivery Confirmation and Signature Required services will increase by $0.25 per package, and Adult Signature Required service will increase by $0.50.

On December 1, 2005, you may view all On-Demand Rates and accessorial charges for 2006 at ondemandrates.ups.com. Updated service and rate information, as well as a downloadable copy of the 2006 UPS Rate and Service Guide, will be available on ups.com on January 2, 2006.
Thank you for the business you entrust to UPS....

They're just doing that to keep up with the USPS rate increase because
they have the opportunity to get away with it :(

Then again - there are "non-profit" sites that have NO commercial
content; won't accept advertisers, sponsors, etc. - yet they manage to
keep online just fine. Just a matter of principle with some.

best regards...

Actually by law UPS and its competitors must charge three (3) times what the Post Office charges for its priority packages and letters. UPS would love to reduce its rates. It would mean more business for them.

Simple answer. It will not cause any damage to your radio. All it means
is the variac will supply 12 amps and the smaller one less. Why would
you want to do this anyway?

I'd like to see that in writing. For domestic shipping, FedEx is often
cheaper than USPS (I don't have the option of using FedEx or UPS, since I'm
at a military APO). The upside of this is, if I DID use FedEx for US
shipping, it would cost me over $200 for a 20lb parcel.. but USPS charges
only for shipping from San Francisco to any point stateside.

I think he meant that as a joke :)

Since I'm a fellow Zone 8'er it irks me to no end when some schmuck in New York or PA wants to charge me more (I'm in Puerto Rico) when the cost to most anywhere west of the Rockies costs the same. Often its less to here than to The West.

A question, Bren...do they do the 7.70 Flat Rate Priority for APO addresses? They do here but I consistently have guys quoting $10-20 for priority mail for small heavy stuff because they don't know the system...or they believe what the goofy postal clerk told them :)

Yep, sure do.. and the other size Flat Rate boxes as well.

Know what you mean about soaking you on shipping.. I see them all the time that want to add heavy extra charges to ship to APO/FPO (even when their normal shipping is via USPS!!). There was one seller I saw the other day with a SMALL ITEM (think it was a friggin' piece of software) that wanted to charge an EXTRA $30 on top of his already ludicrous $15 shipping cost to ship to me.. and he shipped only via USPS Priority mail. I steer clear of those sorts of crooks.

Know 'em well. Of course that extra $30 is justified for the "extra
paperwork" :-)
A pox on these sellers that think US postal rates end at "Conus 48" I
think most of these "Conus 48" guys are just clueless and parrot what
they hear others saying.

SOLDERSMOKE!
KL7R AND M0HBR PODCAST
FOR HOMEBREWERS!

Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?

Mike, KL7R in Juneau Alaska, and Bill, M0HBR in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We have recently started recording these conversations, and are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience.

To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the program using the audio software on your computer.

http://www.ourmedia.org/node/47682

We hope you enjoy the program. Please send us feedback.

The rates can't go down, because the economy keeps inflating.
The inflation rate may be slow, 1% to 5% per year, but it is
inflating none the less.

Everyone wants their salaries to keep rising, so ...

Whether or not I voted for Bush is of course, immaterial. Do you
recall the level of inflation that existed when Carter was president?
How about the relative gas prices? Oh, probably not, you weren't born yet.

It is rare for a person's wages to go down. They become such spiteful
unhappy campers when that happens that companies would rather lay them
off than lower their wages.

The economy keeps inflating cuz we have a president who spends money like a drunken sailor on a saturday night. The national deficit is trillions cause he doesnt know how or want to balance a budget. Course we got a War going that is costing us billions and dont forget our prez's oil buddies who got a nice tax cut while making billions in profits. Not surprising UPS has to raise rates when diesel is $3 a gallon or more....

I havent even mentioned about ham gear going up cause the yen is strong against our deficited dollar- and its going to get much worse.

I think they're just trying to deal with higher fuel prices. One of my regional delivery services, Lone Star Overnight, now adds a "Fuel Surcharge" to all deliveries. It's about $1.50 to $2.00 for a run of about 180 miles.

CwGet is pretty popular:

http://www.dxsoft.com/micwget.htm

Lots of programs decode CW but can be overly complicated as they try to
do everything else too. This is fairly straightforward without being
backwards if you get my drift.

Cheers
Andy

Bullshit -- to the extent that wages don't rise with
inflation, they're going down. Except for the employees at the top,
whose wages go up even as the company goes down the toilet.

There's also the well-known model of "encouraging the
employees to work another 10% of hours per week. Of course it's
voluntary, but guess what -- it'll be "noticed" the next time the
paltry "raise" comes around.

They become such spiteful

I'm trying to figure out why you are saying BS. I said that wages
don't go down, so the economy keeps inflating. You said that when
wages stay the same they are going down because of inflation.

Can't you see that we are both saying the same thing?

-Chuck

Lazy dont gotta worry about wages, he's retired. Old Lazy's gotta worry
about the President trying to steal his social Security and Pension and
give it to all the Prez's rich friends......

Ole Lazy's also gotta worry about his grandsons getting killed in Iraq too.

Iraq, geez, when will we learn???

I just heard that the war has cost every taxpayer about $27,000. That will have to be paid off over how many years now of deficits and cuts in services?

It just makes me so mad that we let W (and mainly Cheney and Rumsfeld, who had been planning this war since before their days in Bush Sr.'s term) run us into this. I had a "No War" sign on my lawn from the start... so, I can speak, not like the "hindsight" hawks.

Imagine if we had gone in there with massive infrastructure improvements. Iraquis would sure be on our side, we wouldnt have lost 2000+ men, nor would we have killed 20K+ of them. What a disaster, morally, economically, and ultimately, for years to come, for our homeland security. Our image in the world is shit. Those tribes done forget like we do a few years later! Anyone hear from Osama lately? NO, he's smart. Smarter than us. He'll be back, maybe 5-8 years from now when our $1.98 security is in full force.

It's the same in other industries too. We received a rate increase
from our power company because of fuel costs.

Dunno. But it's interesting... after the end of WWII, the amount of surplus equipment on the market was amazing. Even considering the total cost of the war being so high, it was amazing.

After Korea, after Vietnam, after the Gulf War, there has been a move to shrink the size of the military a little, but nothing like what happened after WWII. And nothing like the amount of surplus stuff came out either.

(There _was_ a lot of interesting captured radio gear on the market after the first Gulf War, though. Lots of ex-Soviet VHF-LO gear. Prices weren't so low, though.)

Some of the wideband HF surveillance systems that were installed in the eighties should be about getting ready for boatanchor status, shouldn't they? I'll be looking forward to that.

But it'll be very interesting to see what happens after this war is over, or at least when the buildup is over. Lots of UHF satellite gear coming down the pike in another five to ten years?

We dont need to ridicule, or make fun of, or call names of people we dont agree with. Nothing wrong with disagreeing and showing someone the error of their ways. What I have a problem with is (many people with egos on this forum do this) trying to belittle people.

Disagree YES - belittle, call names - NO.....

If that is your stance then you probably don't need to be on Usenet.
You either get thick skin or leave. It gets really rough sometimes
without moderation. I get a lot of crap but give it too sometimes. I
find that moderated forums are the place to go if you have thin skin.

> does it assume?

ignoring any personal feelings i have against the war for other reasons:

lets say its high. lets say that is more than twice as high as what it is.
lets say its only 10,000 per taxpayer. do you pay taxes? how many years
would it take you to pay 10,000 in taxes if they jacked your taxes by
500/year? do you want to pay 500 more a year for the next 20 years just to
pay for this war? if mark is right, thats 1300 a year more for 20 years....

whatever the cost, its high and we still need a plan to pay it off.

4972. MESSENGER 500 HIGH DRIVE AMP

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-21 02:45:21 UTC
From: GHB <ghb_2000@earthlink.net>
Message-ID: <5xagf.3510$wf.1275@newsread3.news.atl.earthlink.net>
Source record: 15261

Does anyone know how much power is needed to drive this amp to full output?
Also, does anyone know the modification to convert this amp to a regular
Messenger 500?

Gordon

Both -- YES. The bright ones can separate the two. The not so
bright ones will focus on the unpleasantness to the exclusion of the
topic.

wow, this swerved way off...from UPS service to taxes to the war....totally off topic, sorry, just went down this path I have to say my last...

bastards? most of the dead did nothing against us... ever. They just got in the way. You can be sure that their relatives want to hurt us, now! Why is it everyone else is an enemy until you meet them and realize they are human, just like us, they want to live and be prosperous. They have children, mothers, and fathers. A smaller group has taken up arms against us... and, for reasons you might agree with if you were there.

Religion teaches there is absolute good and absolute evil, and thats what W and the other nuts that lead us into this believe. Big trouble, there. Well, guess what. No person, no country, no movement, just like no radio, is absolutely good or bad. There are very good reasons some of those Iraqis are against us. If you were raised there you might understand that. But rather than fix that, we made it worse. REmember, this war has NOTHING to do with Al Queida, except they like that we are wasting our time while we weaken ourselves and disaster recovery efforts.

IF you could ask an insurgent why he's shooting, the # 1 answer is to protect his country from the invaiders, the "evil" USA. OK, that's not the smartest thought, but , thats what he believes. Hmm. If we werent there, the shooting would decrease. Yes, there will be some other war, now that we stirred the pot, but it has nothing to do with us. They gotta sort that out. No country is gonna be safe because of us.

Hmmm. The "Coalition of the Willing? ... guess thats like putting up a sign that says "watch out for this sign".

Not to mention the wounded, suffering slowly with no medical facilities, no one to help. Starving because they cant work and because we have destroyed what little support systems there were. Imagine that in your own neighborhood. Just try. War is hell, just ask any soldier.

You DO understand that the Iraqi citizens never plotted to attack the USA, and had NO connection to Al Quieda. Too bad W , and much of the USA hawk populus still doesnt understand this. There was a nutcase leader. IF we needed to remove him, we could have done that pretty surgically, and not shot up and bombed the whole country. Remember, Saddam's followers deserted after his fall. They were ready to sign up with the new president, or whoever pays their salary, but we botched that up and let massive looting

break out.

When's the last time you heard W say "weapons of mass destruction"? Seems thats all he could say in 2002... kept at it. All the experts, and other national leaders, said, no. Well, Kim Jong Il sure has them.... hey, lets bomb him! Pre-emptive strike, right?

George Sr. knew these problems. At least he had some foreign experience. He tried to talk W out of it, like he did Cheney and Rummy way back when. Dad turns out to be a genius next to W.

Thats why our real enemies are succeeding. They know we will never take the time to understand our enemies. We like to shoot first and think later. That is why we will never "win" another war, including this mess.

Meanwhile, the extremists everywhere else are laughing in joy at our failure, and why we are going to suffer further attacks for many many years to come.

For how long Cheney and Rumsfeld were planning this, you'd think it was put together by some second grade art class.

Think back to Vietnam.... what great positive change did we make in the world... while spending 50+ of our guys and how many $$$? "We defeated Communism!"
Uh, I dont think so. It eventually defeated itself 20 years later.

Some wars are just, or at least have furthered our cause. WW2, we stopped a madman. He rose to power because of injust WW1 sanctions against Germany, but thats another story. Gulf war, we stopped a madman, and created another (Osama + Al Queida).

I'm done here. Too depressing...Back to our usual on topic discussions....

Source record: 15267

I am planning to order meter illumination pilot lights for my Drake L-4B from Play Things Of Past http://www.oldradioparts.com/. The pilot lights are type 1850, 5V @90 ma, bayonet. I would like to know how easy/difficult it is to replace these bulbs. I am hoping that all I need to do is to remove the amplifier top cover. The instruction manual does not mention replacement of these pilot lights. Maybe they did not anticipate that the amplifier would still be in use after 30 years.

I got to agree, if you run a 40 year old vacuum tube amplifier and have to ask for help on changing a damn pilot lamp.....

Do you even know how to properly run the amp? Can you identify when your amp is splatteing or non linear.

Heh, maybe its not even the pilot lamp but the fuse !!!

If you can't find the blue filters, go to your local craft shop, and get
a can of the blue transparent liquid that is used to make wire flower
petals. (you dip a wire "outline" of a petal in this stuff, and it forms
a thin film, like a soap bubble, over the wire.)

The stuff forms an intensly blue/green transparent film that seems to withstand
the heat from the bulb quite nicely.

Well, his math *is* a little off. However, the easily researchable and generally acknowledged figure of *six BILLION dollars per month* ain't exactly cheap...especially when we consider all the problems on the home front, like an out of control health care system and the jobs issue (30,000 GM employees blown out the door today). Maybe we could find a better use for that $6B/month.

From: William Mutch <wcm1@NOSPAM.cornell.edu>
Message-ID: <MPG.1debe33173d4320198984e@newsstand.cit.cornell.edu>
Source record: 15276

I finally got to try using the BC-221 as a vfo on 30 meters, using
a cable with an additional parallel tuned circuit in it to select only
the desired second harmonic. It worked, but the drive voltage was
nowhere near sufficient to drive the rig to full output without adding
another stage of amplification...more of a ball of wax than I want to
get into.
Thanks everyone who responded with suggestions.

This isnt the war cost, this is how much Mr Bush has cost us since he has been in power.Did you even READ the LINK?

You are really pathetic but you cant change the numbers or performance of our President.

Bush started out with billions of dollars surplus from Mr. Clinton. This should surprise no one, Bush's Father had us in the hole too. It took a Democrat 8 years to get things balanced and the present Prez pissed it all away.

He squandered it all, giving tax cuts to the rich and oil companies and so on AND getting us into a war that we didnt need to start. Now we are 8 trillion in the hole with no end in sight.

You are a breath of fresh air in this forum. Whenever Conservatives cant prove you wrong they call you a Liberal or try to ridicule you.

Aint nothing wrong with being a Liberal, nor is there anything wrong with being a Conservative. They all make mistakes but Bush conservatives NEVER admit they are wrong or make mistakes. that is why they are so dangerous...

Lazy Senior

Back to the math, my calculations show that a $9 trillion total national debt with 300 million people is $30,000 for every man, woman and child - from babies in the cradle to old people, taxpaying or not. Family of 4, that's $120,000 owed to the nation's creditors.

If the war costs $200 billion (pulled that out of my butt, but it's way more than the initial $87B), that's $666 for every man, woman and child. Nice round number huh. :-)

I wonder what the vote would have been if it had not been in Congress but by a vote of the people, worded thus, "Should the government charge you $666 for each man, woman and child in your household, to attack a country that has never attacked the United States, with whom we are not currently at war? BTW this is in addition to the current war in Afganistan."

It would have been 299 million against.

I am looking to buy any vintage, bakelite cased operational amplifiers from the above manufacturers and others such as Philbrick, TI, etc. I am especially looking for any in case colors other than black as well, black being the most common. Cases are approximately 1"x1"x1/2" with 6-7 leads off the bottom.

And what if they had worded thus "Would you be willing to pay $666 so
that we can begin breaking up the radical muslim gang of thugs that just
killed 4000 innocent Americans and threaten to kill more?"

There are people who spend more than $666 year at Starbucks.

Of course I didn't.

John Burns asked:

"What has the monetary cost of the war been up to this point,
and how many taxpayers does it assume?"

And you replied:

"The estimated population of the United States is 297,767,295
so each citizen's share of this debt is $27,189.05."

You were clearly either very lazy in your response, or trying to imply
that the war has cost $8 trillion.

>

The president proposes the budget, but it is congress that legislates the budget. It doesn't matter how sane the budget presented by the White House is, after congress gets done adding their pork to it, it is insane. I'm still looking for that line item veto...

10 MHz crystals in smaller packages are a couple bucks off the shelf,
and it doesn't take a lot of time to slew the things up to higher frequencies
with a little jeweler's rouge.

You can get brand new ones cut to frequency for twenty bucks or so from
ICM, but that would be cheating.

I replaced the ones in my L-7 with common type 47's. The 6.3 volt
bulbs give adequate illumination and should last forever on 5 volts.
The 5 volt bulbs are kind of rare.
On the L-7 all you have to do is remove the cover. The bulbs are in
sockets right at the meters. I presune the L-4 is the same.

Thanks for your helpful suggestions. Yes, it looks like the bulbs are socketed (aimed towards the front panel), but it wasn't clear to me if I had to remove the front panel in order to get maneuvering room. As others have suggested, it should be a "lark" to replace the bulbs unless the glass breaks off with the bayonet base still in the socket. Then it might be time for some strong language.

In the (unlikely?) event that the glass breaks, you can use an
appropriately-sized bit of rubber (the eraser on the end of a pencil,
or one of the slip-over erasers) as a tool for removal: just push it
down into the metal base as far as you can, then twist. I've done this
more than a few times with old pilot lamps.

Is the driver in the rig designed to work as a frequency multiplier?
I'm not convinced that the output from the VFO has to be free of
harmonics. That's the job of the driver plate (or PA grid) tuning, and
the output pi-net to take care off.

Then you explain to me why the US went into Iraq? To steal the oil from them? Cuz Saddam threatened to kill Dubya's daddy? To build that pipeline across the country to the Caspian Sea? (no, wait, that was Afghanistan). Just to fill the pockets of Dubya and his cronies with cash?

Think like an mature adult. Iraq has nothing directly to do with Bali I and II, Madrid bombings, London bombings, pushing Irving Klinghoffer off of a cruise ship in his wheelchair, Beirut hostage taking, chopping off Daniel Perl's head...on and on for the past 30 years. But what they DID have was WMDs and a propensity to use them against their own internal enemies and a sympathy with the nutcases waging war against the West. Its pretty clear that Saddam's Iraq had the MOST resources at the disposal of factions like the 9/11 murderers and was a good place to start.

You cannot separate 9/11 from today's Iraq. The little mini-incidents that the radical muslims have perpetrated against the West pale in comparison to the 4000 lives lost right here on US soil. To not do something about it would be folly. If 9/11 had not occurred, we wouldn't be there. In that sense Iraq has much to do with 9/11.

I respect the people who must make these bold decisions and the foot-soldiers obliged to carry out the task. I'm neither a politician or a military strategist - and subsequently I'm not a Monday Morning Quarterback calling the game that isn't finished yet. I'm glad this type of whining "it costs every taxpayer $xxx" didn't happen in 1944. Back then "Blame America First" wasn't very fashionable.

Message-ID: <9jtgf.2687$q93.985133@twister.southeast.rr.com>
Source record: 15152

After over ten years of restoring vintage radios, I am moving on to other hobbies (SWLing, woodturning and digital photography). I have a shop-full of test equipment available, including parts and a few radios. I would like to sell the entire shop as a package to someone who would like to begin the wonderful hobby of radio restoration, or who would like to expand their existing shop. I am not looking to "get rich" on this equipment, and am prepared to be very reasonable on the price(s).

If you are interested in this equipment, please drop me an email and I will send an Excel spreadsheet with the list and descriptions of the items.

Thanks,
Walt

I dunno about anyone else, but I'm still waiting for the explanation
as to why the US went into Iraq.

Best argument that I have heard is that we needed a place in the mideast
to put some pressure on Saudi Arabia.

But for the most part, I haven't heard any reasonable explanation for why
we went into Iraq, and I'm still waiting.

Yes, but back then we had a more limited set of enemies, and we knew
who they were. (Well, for the most part. It was hard to tell about
Stalin.)

| Back to the math, my calculations show that a $9 trillion total
| national debt with 300 million people is $30,000 for every man, woman
| and child - from babies in the cradle to old people, taxpaying or not.
| Family of 4, that's $120,000 owed to the nation's creditors.
|
| If the war costs $200 billion (pulled that out of my butt, but it's way
| more than the initial $87B), that's $666 for every man, woman and
| child. Nice round number huh. :-)
|
| I wonder what the vote would have been if it had not been in Congress
| but by a vote of the people, worded thus, "Should the government charge
| you $666 for each man, woman and child in your household, to attack a
| country that has never attacked the United States, with whom we are not
| currently at war? BTW this is in addition to the current war in
| Afganistan."
|
| It would have been 299 million against.

Where is your memory? What do you think he gassed his Kurdish citizens with? Does that not count as a WMD or do you have a stricter definition? Why were UN inspectors there so many years? What about the program to DISMANTLE such manufacturing facilites after he invaded Kuwait. Why did he throw out the inspectors?

Convenient for your side of the argument that you omit the implications of 4000 murdered on US soil and the need to mitigate such occurences in the future. Your 'side' is very short on alternative solutions but very long on criticism.

Bad recent intelligence? You betcha. No denying that. Sold a bill of false goods by the President to start a war without any discernable reason? Lets use the same standard of proof and stop playing partisan roles.

WMDs or not the underlying issues remain and thats the radical doctrine of killing anything/anybody Western. We've got plenty of proof there. Do you need proof that the Saddam regime was sympathetic to this cause and was a major point of instability in the region?

We ain't gonna win this one with simple hugs and trying to be good neighbors...and we damn sure won't win it with internal bickering. Bring us a good candidate to deal with this 'quagmire' in 2008.

Good night,
Bill

5021. Harris RF 230 help needed

World Radio Labs / Galaxy of Council Bluffs, IA (later purchased by HyGain in Lincoln, NE) existed until the late-1970s.

Since this unit uses ten (10) - 6LB6 sweep tubes it is not a practical amplifier -- since these TV sweep tubes are no longer produced. Might be a nice project to convert it to a couple of Russian triodes. I would sell the tubes for the $$

As I remember,
All you do is to dial in the desired frequency and hit the save button
on the memory pcb. There is a function switch on the memory pcb that
associates the inputted frequency with one of the front panel dial
positions. Another function position allows you to do direct frequency
entry on the memory card regardless of the dial position.

If there are two memory pcbs, you may program the unit for duplex
operation, sending on one frequency and receiving on another.

If you keep the rig you really should have the manual.
I wouldn't even buy one of these without the manual.

The manual is about the size of a large city telephone directory and
would probably cost around $300 to $500 from Harris, if still
available. Try to get one from another user.

I sold one of these rigs at a local hamfest about 4 years ago and my
manual went with it.

John:

The amount of $$ appropriated for the Gulf War to-date is ~averaging
4.8 billion-with-a-B dollars per month. Allow 24 months, that comes to:
$115,200,000,000 .

115,200,000,000/285,000,000 = $404/person.

As of November 5.

This does not count the thousands of contracts for 'infrastructure' and
other items. That total brings the cost-per-capita to around
$750/person excepting those employed by Haliburton.

I would still rather see that money spent in West Virginia for schools,
or Mississippi, or Louisiana, even Texas, Alabama or Arkansas. God help
us, even Camden, NJ. At least when my present-and-future grandchildren
are paying it back there will be a discernable benefit.

But that would be too much like thinking from an administration
bankrupt in that skill.

What is really important is how much of that money spent on the war,
goes directly back to the US citizens. Much of this money supplies
jobs right here.

Greg:

I spent some time in the Middle East, with Haliburton being one of my clients, amongst others. Sure, _some_ of the $$ goes back to the US in the form of jobs. A good chunk of it goes back to the US in terms of profits for the various companies. I suppose it could be argued that those profits are spent in the US, so that could be a good thing as well.

At the same time, the significant majority of the money is spent in-country/in region for support services, labor, materials, etc.. Such as the gasoline purchased at $0.73/gallon in Kuwait City and resold to the US Military in Iraq (400 miles away) for $3.02 or so. I would suggest that if 100% of this money were spent in the US for things that actually benefit US citizens directly, perhaps the country as a whole would be better for it? Just a thought.

It also gripes me some that the US Military is required to pay a 414% mark-up for fuel and at the same time cannot deliver proper equipment to the troops on the ground. Does it bother you that American Troops are _still_ forced to scavenge junk yards for pieces of steel to fabricate into armor? Does it bother you that private citizens, parents and Veterans Groups are _still_ purchasing body armor OTC and sending it to our military in Iraq because they are not getting that protection directly? Does it bother you that the "military intervention" (since war has not been declared) is neither fish-nor-fowl? That is, it is not being pursued with any clear operating strategy and certainly no exit strategy other than amorphous, ill-defined goals? There are not enough troops to provide any level of safety either for common citizens or even the troops themselves. There are too many not to provide regular and easy targets to the tune of about 2.7 per day, on average, fatalities. Not to mentioned wounded and crippled, not to mention US citizens as private contractors in the region. And certainly not to mention the innocent Iraqi citizens killed for no other reason than by being in the wrong place at the wrong time... many of them even while attempting to work for the overall betterment of their nation.

Introducing Democracy: What a naive and silly hope. A country consisting of four rejected groups warring for over 1000 years, created by the British and held together by a "strong-man" form of Government. Don't the Balkans have ANY meaning any more? What happened when Tito died? And what is the results today some 25 years later? It won't take any 25 years in Iraq as the factions have hated each other for far longer and the fights have been much more bitter.

The Shi'a were rejected by the Saudis.
The Sunn'a were rejected by the Iranians.
The Kurds were rejected by the Turks.
The Druze were rejected by the Jordanians (and are the forgotten sect in the equation).

They all want homelands. They all more-or-less had tribal autonomy before the Brits came along. They have all been fighting each other to one degree or another for well over 1000 years. The parties are playing the game, some even sincerely, until the 900 pound gorilla leaves. Then you will see the reality of that region at the fullest. I truly hope to be pleasantly surprised. I do not expect to be.

And we have not even begun to discuss the other countries in the region. Iran (Farsi-speakers and NOT Arabs) fear a strong Iraq, Shi'a or otherwise. The Saudis fear a Shi'a state to their immediate north, especially one that is fundamentalist. The Turks are flatly terrified of any sort of autonomous Kurdish zone on their southern border. And the Jordanians are caught in a vice between whatever and Israel. It ain't nohow pretty.

We need to quit mindlessly waving the flag and get down to cases as to what _CAN_ be done. Within that range what _SHOULD _ be done, and within that range, how much we are willing to suffer as a nation to accomplish that. Sadly, however badly the war was conceived and whether or not the so-called intelligence was manipulated maliciously or not, the US is in there, by its presence it OWES that poor crushed country a good result, yet that getting to that result appears to be beyond the national will to deliver, even by those most actively defending our presence there.

Even allowing for the fact that not all capitas are taxpayers, that is still a far cry from the earlier claim that the cost was about $27,000 per taxpayer!

From: K3HVG <jeepp@adelphia.net>
Message-ID: <vYednRCWmtlT7R7enZ2dnUVZ_sKdnZ2d@adelphia.com>
Source record: 15180

I recently acquired an RCA Radiomarine model AR-8506-B. These receivers are usually associated with the RCA Model 4U radio units and were installed on Liberty and Victory ships (and others). My unit is curious in that it has a typical, triangular Signal Corps acceptance stamp on it and holes drilled (tag missing) for a smaller tag than was supplied by RCA for 4U systems. The case has the regular RCA maritime acceptance/usage label inside and the receiver, itself is also standard issue 110v AC/DC input. I've worked on these receivers on a Liberty ship so have the books, etc. Anyone know if the Army had some of these?

Thanks..

Poor amp, runs about a dozen old TV sweep tubes with all the problems that come with them! It was a joke when first built, and hasn't improved with age. You can get a nice Heath SB200, SB220 or SB230 for equal or less money.

Some CBer will likely get this rag and hopefully blow it up first key-down.

Exactly my point. When arguing, uh... discussing... uh, having a food-fight over politics the truth is a great deal more useful than wishful thinking and shoddy anecdotes. However it is not terribly popular nor terribly effective at changing 'popular perception' as any campaign manager will tell you. For that, one needs mud, deception and many shades and distortions of 'facts'.

The damnable part of all this is that none of it was actually necessary. But 'we' are in it now. Clinton could not keep it in his pants and got impeached and survived the experience. GWB could not keep in in his pants, and 2000+ American Military are dead along with thousands of American civilians, and tens of thousands of innocents of several stripes. Which do you _honestly_ think is worse?

Never get into a fight with a guy littler than you are. If you win you are a bully, if you lose you are a bum. And either way the other kids in the playground either fear or ridicule you. If everything we need to know we learned in Kindergarten, that is one lesson missed on Capitol Hill & the White House.

WHOOPS!

You are correct. Civilian contractor deaths are ~285,
collateral-in-region (Working in Saudi, Jordan, Turkey, Qatar and
elsewhere, dead from specific attacks by al Qaeda on Civilians) exceeds
1000. All 'western' civilian deaths contractor or otherwise in Iraq
also exceeds 1000. Mixed up too many numbers. Don't forget I was ~200
yards from the Oasis/Petroleum Center incidents last year in Al-Khobar
when the (American) wife of a friend of mine was shot up very badly
(she survived), and many were killed.

Point being that none of it was/is necessary, and any positive results
are dubious at best.

Hi,

This amp would +not+ be a good candidate to change
to Russian high power triodes:
The Galaxy power supply HV is only about 1000VDC,
and the linear's output tank circuit uses a "trick" circuit
to compensate for the high output capacitance
of the ten paralleled sweep tubes.

They used to say that the key for economical operation
was to change out all ten tubes for a matched set,
once the output dropped to an unacceptable level.
If you just substitute one or two new tubes at a time,
for the weakest ones, the new tubes beat themselves
to death in a hurry, trying to carry a lot of the load.
WRL used to sell matched sets of 10 tubes for around $30
when the amp was still being produced. $30 is now about
the price of +one+ 6LB6 on the audiophile market.

One interesting feature of the amp is the way the operating bias
is made to shift more toward class A if the rf output voltage envelope
departs from being linearly proportional to the input rf
voltage envelope. I never owned one of these amps,
so I don't know how well that worked in practice.

73,
Ed Knobloch

Since the start of hostilities on Gulf II. I thought that was pretty much the only time-period under discussion at the moment

And they do. They really do. Most do not want to hear it, however. It was on NPR some mornings ago, part of a 'regular' weekly feature. I am thinking it was last Thursday, but it could have been any of the mid-week days last week that I heard it.

Generally, I tend to discount most of the privately developed body counts unless sourced from two independent entities. For instance, Iraqi civilan deaths range from ~25,000+ (US military unofficial estimates based on reported deaths from publicized incidents) to 100,000 (The Lancet) to 250,000 (local sources not to be trusted at all).

And "the media" is hardly pro or anti anything in its entirety. Certainly Fox is different from CNN, and Sky makes Fox look like a Liberal Bastion. It's all in accordance to what you wish to hear, what you wish to believe, and how much you choose to question "Received Wisdom". But then, most of us are acutely uncomfortable when we are confused by information that conflicts with our carefully managed and protected opinion. We would rather vilify the source of that information than allow our opinion to change.

Man Lazy,

You have a lot of trouble understanding simple stuff. Clinton got impeached... Yes he did! He was found not guilty, and continued as president.

Where exactly were you during the Clinton presidency, Antartica?

Just incase you want to read about it:

Thanks for the information. I have ordered 10 bulbs (@38¢ each) from Jamco, and I will soon find out how much of a pain it is to replace the bulbs. If replacement frequency is too high, I will follow another person's suggestion and replace the bulb with a 6.3V version. In your estimated life for the 1850, you listed the estimated life as "1,5000" so I'm not sure if you meant 1500 or 15000 hours. 1500 hours seems a bit short. :-)

Sorry John - typo. CML shows it as 1,500 hour estimated life --
yes that is SHORT -- if left on full-time - that is not even a year.
I usually substitute for same or similar brightness
and longest bulb life from CML charts!!

LED is the other choice -- but liight characteristic differences -- do not
match all applications.

Good for you! We go to the middle east for 2 different reasons that is
for damn sure. It has nothing to do with testosterone. It has
everything to do with supporting your country. I think in your case
you should have stayed with the people you love so dearly. We sure
don't need or want you here.

Jammer,

Yes, it was a great experience, one I have been fortunate enough to share with a wife who was as much into the hobby as I. The idea of mamoirs has occured to me, but that's really not my thing. I have written a couple of articles for Electric Radio magazine, and was a regular contributor to this and other radio-related newsgroups.

I am into SWLing now, so will be keeping up with the groups. Be sure that you, too, share your knowledge with the groups. It really is a wopnderful way to learn a lot and have fun in the process.

Happy Holidays,
Walt

I frequently see the term "rare" mis-applied here and in other electronics newsgroups, but it certainly seems justified in this case. These were sometimes used (with the appropriate drawer) for antenna radiation pattern studies made in the field for FM and VHF/UHF TV stations. This is a top-of-the-line mil-spec receiver, and this example does indeed appear to be in exceptional condition, probably needing only relatively minor repairs and then calibration with a standard signal generator to put it back into perfect operating condition.

For those of you not familiar with Nems-Clarke, they were best known for a number of receivers and meters used to measure RF field intensities. Many of their standard broadcast band field intensity meters manufactured 40-50 years ago are still in use at directional AM radio stations - I have used them at several stations over the last 30 years.

I agree it is a fine looking receiver. I believe the signal strength meter
does not follow the signal, because the AGC is off (manual), so I emailed
the lister with that thought. The CRT display shows a noisy signal, but
that may or not be a problem. If it is a trouble condition, it's not
serious.

You are right there. Too much Ebay mentality. Used to be it either worked or didnt.

I recently bought a Viking Ranger at a hamfest. I asked if it worked. The guy said he was selling it for a friend who said it worked when he last used it many years ago.

In other words as far as I was concerned it didnt work and payed accordingly.

Shouldn't that have said "Not tested, but the guy I'm selling it for said he
used to work New Zeland all the time using it barefoot on 80M."

Thanks for the thought, but I was mostly pulling your leg. But it is
something I do in some of my work just to get the frequencies I want without
committing a big piece of hardware to a simple task.

Hello All!
I have the following for sale: Get em for Christmas before they go on ebay !
Make an offer !

HEATHKIT SB200 LINEAR AMPLIFIER. Very Good Condition- No dents or scratches.
Loaded 400 watts carrier out into Cantenna dummy load.
Has manual. Pics available and will ship CON. US. but prefer local P/U in
Cleveland Area -- will drive 1/2 hr..

3KW ANTENNA TUNER. MFJ989C with digital readout in Very good condition.
Small dent in chrome of tuning knob.
Has manual. Pics Available and will ship CON. US

KENWOOD TH22A 2 meter HT. In excellent condition. Has leather case and 2
extra batteries. Original box and manual
Ac supply etc. Pics available and will ship CON. US

SPEAKER-MIKE for above . Works GREAT! Pics available and will ship CON. US

5096. Question on RFI and tube vs newer rigs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-23 23:09:45 UTC
From: gil <gi1pi@yahoo.com>
Message-ID: <1132787385.950101.273360@g44g2000cwa.googlegroups.com>
Source record: 15235

Are tube rigs more prone to giving RFI than newer solid state rigs?

An example, an older Heathkit SB 101 vs an Icom 735, both at 50 watts, same antenna and ground, which one would be most likely to create more problems with phone, TV etc ??

Gil

5098. Re: Question on RFI and tube vs newer rigs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-23 23:37:07 UTC
From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <D27hf.149$YT3.25@newsread3.news.pas.earthlink.net>
Source record: 15237

There are different issues with phone and television.

With regard to telephones, harmonic output of the transmitter makes little difference. The phone is acting as an untuned crystal set. It is simply defective design based upon mass production. It does not make any difference what type of transmitter is being used, nor what frequency it is on (generally). Interference is caused because the telephone has no rejection. Interference can be reduced by moving the transmitting antenna away from the telephone and telephone lines and/or by preventing the rf from getting into the telephone. Interference filters are sold for telephones that work in most (but not all) cases. Also, ferrite clamp ons may help.

The television is a bit different. Most likely, the same problem as outlined above applies to televisions, also. But, if the affected television uses an antenna (rather than cable or satellite), then harmonics could be involved. Since older tube rigs were not required to meet as tight of harmonic specs as the newer solid state rigs, it is possible that older tube rigs might be more likely to cause interference to television sets.

In most cases, it is the television that is the problem, rather than the transmitter. A more modern tube transmitter would be about the same as a solid state transmitter in terms of liklihood to interfere.

BAMA has the following information:

An Italian site, Marcucci, has a good collection of Icom manuals.

Speaking of ICOM, you can now download manuals on most of their equipment, both past and present from their Support Page. Furthermore, a note at the bottom of the page says, "If you cannot find the intended instruction manual you require on this download page, you can make a request to the Support Center to have it uploaded." Way to go ICOM!!

For much technical material on ICOM equipment, Adam Farson, VA7OJ/AB4OJ, runs a site which includes many manuals as well as links to other sources of ICOM info.

This information may be more helpful than my last post.

If the phone gets bothered, it is broken. If your CD player/record player/cassette deck/stereo get bothered, they are also broken. Your VCR was born broken, as its tape stores frequencies from DC thru the 80m. Any of the above devices will be affected equally by either rig.

As to interferrence with devices that are intended to be receivers, the Icom will likely be the worse offender. First, it is broadband in its drivers and finals, so it will be producing lowel levels of white noise over a significant bandwidth. Second, it is synthesized, so it will be making a fair bit of phase noise. And third, it is digital, so there will be some switching noise too. I find that it is miserable to work on the same band with a modern SS transceiver in the very near vicinity (same shack, next door, Field Day..). But the new ones are much better than they once were.

The tube rig has very sharp tank circuits that resonate each stage on the frequency being transmitted. It has a PI type loading network that helps with antenna matching, and acts as an additional filter. The tube rig will likely emit harmonics of the desired frequency, so you can expect some interferrence that way. And the tube rig will have some interesting frequencies that result from the internal mixing schemes that will produce some hot spots.

All-in-all, it doesn't much matter. Big RF will crunch most consumer electronics, thanks to the FCC sell out that allowed the manufacturers to leave the RF filtering off, and only add it back if the owner can figure out who to ask for it.

All,

I've occasionally seen homebrew tube transceivers on Ebay that range from really good to too gnarly looking to seem safe. I am thinking of creating a line of clean-looking, attractive, rugged tube equipment for casual or missionary use with a reasonable price/output performance that is easy to repair and adjust, based on schematics and design principles that have gone into the public domain.

Would there be an audience? Comments?

Some of the older tube transmitters were more prone to TVI, since the manufacturers didn't bother with TVI filters since there were not many televisions around to bother! By the time you get to the gear made in the 60s (SB series, DX-60, etc.) the transmitters usually included a multisection 30 MHz lowpass filter on the output. Transmitter shielding is also important.

I doubt you could build them cheaper than available (used)commercial equiptment. It would have to be a labor of love, I dont think you could break even.

I used to build my own computers until 6 years ago when I figured out I could get a Dell or HP much cheaper than what it would cost to build.I suspect building tube radios would be the same scenario.

You need to get intouch with the company that made the phone, and
tell them you need the RF interference kit. Call the 1-800 number
that is printed on the phone, and they will send it to you for free.
If they don't, then call the FCC and complain about the phone
manufacturer.

More than that, the meters were often screened, and the AC line
cords had RF filters as well. This was mostly to reduce harmonic
radiation from the cabinet, which could be carried "common mode"
on the outside of the coaxial shield, or on the power cord.

Phone interference is overload related, and has nothing to do
with the quality of the transmitted signal. The phone is overly
sensitive to strong RF fields, regardless of their spectral
purity. As Chuck noted: some simple filters on the phone line
should help the problem.

This is not just about the phone, I guess I used the phone as one example, but I was most concerned whether
an all tube rig would create more RFI problems overall than a solid state rig.

Thanks......Gil

More than that, the meters were often screened, and the AC line cords had RF filters as well. This was mostly to reduce harmonic radiation from the cabinet, which could be carried "common mode" on the outside of the coaxial shield, or on the power cord.

You know as much about computers as you do BA or hamradio. My HP, the one I am typing on right now has an off the shelf non- prop Asus motherboard. A ATI Radeon graphic card etc.Built by HP and bought at Best Buy.

Since I maintained computers for a living for over 30 years, I suspect I know more than the average person about them and since you are stupider than average I know a WHOLE lot more than you when it comes to computers.

Anyway there isnt anything wrong with propreitary motherboards. Laptops are outselling desktops right now and they are all properietary and they work just fine.

Am looking for a 7143 KC crystal, preferably FT-243 but not imperative. I will swap an 80 or 40 meter crystal of your choice (of what I have on hand, that is) and pay postage on both. Thanks and have a nice holiday fellers...

Smokey

I have a 7140 kHz FT-243 military xtal, if it would be close enough.

> think you have a shot.

A few years ago, somebody (Ghostmoon?) offered kits to make an "All American Five" five-tube AM radio. They were quite expensive, and the company did not last.

Antique Electronic Supply (http://www.tubesandmore.com/) offers a few tube-based kits for various things. You could try phoning them and ask what sort of demand there is for that kind of thing in general.

I suppose you would be competing with existing solid-state kits. If you Google around, you can find what's available and what it costs, etc.

Regards,

Phil Nelson

I don't think there is an audience. Here's why I feel that way...

Anybody that wants the hassle of a 'homebrew' tube xcvr just for giggles is well advised to just pick up a $50 HW-100 (or similar) on ebay. You get a slippy dial drive, you get to re-address old problems that were inherent in its original day, you get to fork over the sale price once again for a good set of finals and a few other tubes.

I dealt with some missionaries in the 70s and the LAST thing they wanted was a tube rig. Plug-n-play, never-fail solid-state are where that market is. If you're in the Amazon backwaters of Brasil you don't want temperamental stuff. You can't just check into an internet forum like this and beg a few new tubes and they show up in the mail a week later.

As for home-based hams...there's a definite thrill of using a homebrew rig but all that is lost when its somebody else's homebrew rig.

I'm a proud Galaxy V owner, nice rig, cheap enough, I've got enough sweat equity into it to where I have an affinity for it. I can't imagine anyone else liking it as much as I do.

> Thanks......Gil

You seem to have a classic example of the RFI issue but I don't think you can attribute it specifically to tube or solid-state technology inasmuch as you can attribute it to the tighter rf packaging of more modern rigs. Nothing about tubes per se makes them more prone to problems.

That said, while RF shielding integrity of a commercial xmtr/xcvr has generally improved over the years, the RF integrity of consumer devices, and that includes telephones, has gone down the tubes (no pun intended) since Nixon went to China!

A poorly shielded xmtr in the ring with a cheap offshore home electronic device is a guaranteed KO for both of them.

Heathkit didn't go belly up because kits were not profitable;
Heathkit went out of business because their new owner had no
interest in a kit company, but rather wanted the assets of the
Zenith computer company.

Heath continues to this day making security devices, lamp fixtures,
and a number of other mundane products.

I think that Heathkit had to be put to sleep because the world had changed and Heathkit slowly became irrelevant for many different reasons, some of them permanent, some of them not.

If one keeps those reasons in mind while creating the business plan, then the only thing left to do is to determine a competitive price/performance point based on market research.

My thoughts:

1) Kits are not realistic except in upper end niche markets such as Elecraft due to issues of customer support and liability.

2) I'm not thinking of making rigs capable of world-burning performance for DX chasing or contesting. Most people are appliance operators, sad to say and want to just hook up the rigt to power, antenna, and antenna and go. What I have in mind are gear capable point to point shortwave links, essentially cross-country rag chew, SSB for Generals and above, with CW thrown in for the Tech+ and above.

3) What I can think I can offer in gear is stable operation in abuse-proof enclosures at slightly higher power levels. Part of the way I can do this is to use 21rst century materials and manufacturing methods to implement mid-20th century mechanical requirements.

4) There are also a few natural advantages that tube gear has that semiconductors do not: tube gear is less likely to break upon exposure to dirty power, EMP, and bad SWR.

5) New tubes are still being made by Russia and China and this will quite likely stay that way for the forseeable future. Purists might turn thier nose up at using these tubes, but something workable could be made out of them for a reasonable price.

7) Also, the price of US manufacturing, and labor are just too high for anything other than creating a prototype. Basically I am creating a very useful toy, but only a toy, and will most likely need to import the manufacturing and labor.

8) I should only offer 80, 40, 30, 20, and 18 meters. I want to stay as far away from 10 meters as I can, due to possible use of hacked gear on 11 meters. I don't believe the audience for 160 is very large.

More thoughts?

Oh, I LOVED the Galaxy V mark II. It was the rig I grew up on! When my folks got divorced when I was in college they stored it in a garage and it got rusted out completely. My second best choice is the Yaesu FT-101E or EE, I had the E rig in my first marriage but I lost it in the divorce and bankruptcy. I just got a Yaesu FT-101EE to reactivate the communications part of the hobby. I am a builder, primarly, and have been for decades.

I beg to differ regarding tube gear being tempermental. Badly designed tube gear is certainly inferior to established solid state gear. But well designed tube gear (Collins class and some military) is better than most solid state gear. Success depends on a lot of factoris: electronic design, mechanical engineering, manufacturing methods and techniques, parts sources, pricing, and profit margin.

The FT-101, Galaxy, Drake, and Swan are not $100 pieces of gear on EBay, they are more like $300 to $400 pretty consistencly. I think a fully loaded multiband fresh boatanchor should sell quite nicely for $199.95 it if offers compareable features. That would imply a wholesale price of about $100.00. That would imply that parts, labor, and other indirect costs should be somewhere between $50 to $80. I think I can get from Russia or China a single sweep tube plus a handful of smaller tubes for about $30. The rest would have to be chassis, discretes, power, labor, shipping, and customs.

Now, if I market direct through the net rather than through a retailer, I think I could go self sustaining after a few build-sales cycles.

If the people on this topic would be willing to be a focus group for the fresh boat-anchor of thier dreams, I would be quite grateful.

Anyone remember the Astro-Net on 3885 kc from the 1960s? It was composed
of group of amateur astronomers who nightly trained their telescopes on a
particular celestial object and would then have round-table comments
about that object. It was fascinating to eavesdrop on that net.

Since I dove into this water...I'll continue my nay-saying even tho I
love BAs.

You say FT-101, etc...aren't $100 pieces of gear on ebay. Thats too
broad and maybe your perspective is different than mine. As found
Galaxy V are lucky to get $100, as are HW-100. FT-101, Kwood TS-520,
Swan 350-500, Drake TR-3/4 will garner twice that in "last time I fired
it up it worked" condition. I've given away two Galaxy V in as found
condition this year because they couldn't be sold at any price.

I'm not clear if you are suggesting building these things from scratch
or taking older xcvrs and refurbing them. If you haven't walked this
talk I suspect you'd find out very quickly that paying $35 for an old
Galaxy and refurbing it at maybe a cost of a dozen hours of labour you
might get $125 on resale on a good day when there are no other buyers
that could do the same thing for their own purpose.

To do an equivalent Galaxy 5 from scratch for $199 commercial resale?
No way.
>
> If the people on this topic would be willing to be a focus group for

Ok, I'll buy the part about insults but why in the hell would a real ham
come onto a boatanchor group out of the clear blue and start ragging
guys about buying a Swan?

Tell us which BAs you're running so that we can have as much fun ragging
down your gear. Swan is an easy mark...give us something to get our
teeth into.

And of course, people want the boatanchors because they are old, because they are the rig they had when they were first in the hobby or because they lusted after the rig decades ago but couldn't afford it. I suspect that is the major reason, rather than because they are tube-based. Take away that familiarity, and the interested number will also drop.

People will pay more now the more expensive it was in the first place, but that may be as much because fewer bought them back then (hence fewer exist) than because they are better rigs.

Michael:

How about a thought experiment? Assuming we don't consider copyright, patent, trademark, or other issues. Say God gave me the gift of being able to create a Collins-class rig at 1/2 to 1/3 the usual price on Ebay? Would that be tempting?

Collectors rather than operators, right?

>they are the rig they had when they were first in the hobby
Yes, but also because they found later, purportedly more modern
equipment,
to be harder to operate or repair, or easier to break, with replacement
parts
and labor costing more than the rig itself?

>they lusted after the rig decades ago but couldn't afford it.
And still can't, in the case of Collins for example.

>I suspect that is the major reason, rather than because they are tube-based.
Really? I think it takes a different mentality to operate a tube rig
than a semiconductor or digital rig. I really think the casual tube
rigs were easier for children and adolescents to operate on HF. I had
the worst time trying to understand an ICOM during my 20's, for
example.

> Take away that familiarity, and the interested number will also drop.
But what if I kept the familiarity of operation rather than the
familiarity of brand name? Would it drop drastically?

At this point you are daydreaming. Start pricing the components.
You'll likely exceed $199 before you add in any labour.

Doesn't work that way anymore. In the old days the manufacturer might
have included a card in the manual that you could stick on a 5 cent
stamp and ask why the rig didn't work.
People don't accept that level of service these days.

I'm not trying to be condescening...YOU buy a Gal V on ebay or swap meet
and try to get it playing to satisfaction for a single year of regular
operation...you'll gain a different perspective. I don't think you can
'homebrew' around these issues. Its always 'something'.

Maybe not a Galaxy 5 itself, you could be right. Besides, it was a hybrid rig, not an all- tube rig anyway.

But, what about this lineup for receiver:

1) 3 sets of switchable preselector filter with ganged variable capacitor with a single dual triode amp, half of which are placed between each filter.
2) Single dual triode as cascode IF converter, rather than a pentagrid converter which are hardly made anymore.
3) Single dual triode as differential VFO, glass equivalent of recent QEX circuit, with oscillator variable capacitor ganged to the preselector capacitor as part of same set.
4) Single dual triode as pre and post amps to lattice crystal IF filter.
5) Single dual triode as cascode baseband converter.
6) Single dual triode as differential BFO, similar design to VFO.
7) Push-pull audio power amp... reuse this in transmitter.

Transmitter lineup:

1) Single sweep tube operated class E for CW, modified to class H with aid of receiver's push pull power amp.
2) Share the preselector for use in postfiltering of the power amp.
3) Use the same differential VFO as the input to the class E amp.

This isn't really SSB: it is more quick and dirty DSB/CW transmitter with SSB receiver. (If anyone can modify a class E amp for SSB service I would love to hear about it).

So, this lineup uses a single sweep tube, 6 dual trodes, and a pair of 6L6 equivalents.

Shuguang 807 as sweep tube: $16 retail
Shuguang 6SN7 (VFO) $11 retail
Shuguang 6SN7 (BFO) $11 retail
2 Shuguang 6L6 (Amp/Mod) $25 retail
4 CH-12AX7A $48 retail

$111 retail ==>
$55 wholesale if I can establish a dealer relationship with supplier.

Tubes: (presumed wholeale) $55
Resistors (NOS wholesale): $10
Caps (NOS wholesale): $10
Power transformer: $5 sheet metal stack
made in LDC

4-gang variable $25 (Soviet make
from EBAY)
Chassis: $20 sheet metal
Planetary gear drive: $15 (cast iron gears
from LDC)
Crystals (NOS wholesale) $5
Rotary Band Switch (NOS EBAY) $10

$140
Labor (20 hours at $1/hour in an LDC) $ 20

$160
Murphy Factor (20%) $ 32

COGS w/labor $192

==========

OK, you are likely right that the wholesale cost is high. But I only worked this out in 20 minutes using recent surfing, reading, and other communication. Perhaps with further refinement I can get the cost down. I added a murphy factor for amortized taxes, freight, and customs.

BUT: I think I made it with $7 to spare, including labor, so long as I do not rely on the US for a lot of things.

Maybe $250 would be a more realistic retail price... Not much profit margin, though, but not much needed for mail order sales if I am only intending to supplement income rather than support myself.

Thoughts?

Beerbarrel wrote:
sissies!

It is popular fodder for Republicans to portray Democrats (or anyone else who rubs their fur the wrong way) as a bunch of wimps.

Well, let's take a brief look at history over the last century.....

World War I-Prosecuted by the administration of Woodrow Wilson, a Democrat. The first truly mechanized war, and the first widespread use of chemical weapons in war. The USA and its allies were ultimately victorious, but things soon turned ugly. Wilson's failed attempts to secure a lasting postwar peace led to a complete destruction of his health. Widespread postwar unemployment and a health care system strained to its limits by a pandemic spread by returning troops made victory bittersweet.

World War II-Prosecuted by the administration of Franklin Delano Roosevelt, a Democrat. The most complete military victory in American history led to the emergence of the USA as a superpower, and the pent-up demand for long-rationed consumer goods led to a booming economy as well. But victory came at a heavy price....A quater of a million US lives lost, and a postwar world enormously complicated by the development and deployment of atomic weapons.

Korean Conflict-Prosecuted by the administration of Harry S. Truman, a Democrat. Although some of the same brilliant strategists who engineered the victory in WWII were involved in this conflict (including Douglas MacArthur for a time), The best the US and its allies were able to accomplish in two years of fighting was a draw....Not good for a military action that claimed at least 32,000 American lives.

Vietnam Conflict-Prosecuted by the administration of Lyndon B. Johnson, a Democrat. This war became so unpopular that Johnson was forced to give up his bid to serve the longest period of any post WWII president. By 1968, the nation was the most divided it had been since the Civil War. Richard Nixon, Johnson's White House Descendant, fared little better with the war effort and finally called it quits in 1973 after 55,000 American lives had been lost. It should be noted that many high-ranking officials of the current Bush administration came of age during the Vietnam involvement. Most of them, including the President himself, received student deferments and/or National Guard appointments and did not play a combat role in this conflict.

Desert Storm-Prosecuted by the administration of George H.W. Bush, a Republican. Mission accomplished.....light casualties and total victory over the enemy in a popular and patriotic war. Sounds like a home run, right? That's what the Republicans thought, too....Until voters sent Bush packing in favor of Republican arch-enemy Bill Clinton, making Bush the first single-term Republican president since Herbert Hoover.

It can be seen that the outcome and aftermath of these conflicts is definitely a mixed bag, and that most of them were prosecuted by Democratic administrations. Does the current Democratic skittishness about the Iraq war mean that they are just sissies and wimps-or could it be that it is because the Democrats have learned some awful truths about the social and political costs of waging modern warfare that the Republicans have yet to learn?

Where's the chassis, knobs, tuning caps, IF cans, tube sockets, xtal filters, cabinet, dial, power xfmr, etc? Any radio homebrewer will tell you that where the cost is. Tubes are incidental costs.

Bzzt, if you can provide labour for a $1 per hour and understimate the Murphy factor then you have a chance of breaking even...well no, not really. Using your figure of 20 hours I calculate that you'll clear an income of $40 per week on 2 rigs, $60 if you work nites, if you do it all yourself.

If I could build a Galaxy 5 equivalent in 20 hours...never mind...

Okay. Paying shipping for one single returned rig in this scenario will have you WISHING you hadn't eaten last week's can of cat food for dinner.

Doesn't wash. You couldn't do this for less than $500 per rig (sans labour and profit)....and thats why there isn't the market that you imagine.

Thirty to forty years ago, hams abandoned those old boatanchors.
They wanted the solid state, they wanted the features. The rigs
could barely be given away. Circa 1972 a lot of boatanchor equipment
went through my hands, because people were giving it away, or they
would sell at the radio club auction for five or ten dollars. I let
it go just as easily, because I could trade it for something more
interesting or just to sample what were new things to me.

It's only in recent years that people became really interested
in that old gear. Nostalgia. And the demand raises the prices
of those once useless rigs.

If simplicity is the issue as you think, then through the decades
there would always be basic rigs being manufactured, because
there'd be demand. If people wanted basic, they'd not be
waiting decades for it. And of course, basic does not have
to mean tubes. The bells and whistles were added because ICs
and the like made it easier to add them, but there was no need
to actually add them. There could have been basic solid state
rigs, and of course Ten Tec did offer them, as did some of

the other manufacturers (though Ten Tec lasted longer than
the rest). If you think there's a market for a bare tube
rig because of ease of repair, then it's just as easy to use
discrete transistors (or discretes with some common ICs) to build
a basic solid state rig that is just as easy to repair as that
old HW-100. The only difference is that with a solid state
rig, there's no tubes that can easily be pulled out to take
to the drugstore to test in the tester, which doesn't matter
because the tube tester isn't there anymore, and neither does
the drugstore sell the common tubes that was the purpose of
the tester being there in the first place.

I can't say I'd spend the money, but I want a Clegg Interceptor
from the early sixties. There is nothing about that receiver that
is better than a more recent and decent receiver. It lacks features,
and of course suffers from a relatively high noise figure that came
with the tubes. I suspect its selectivity is broad compared to more
recent receivers. I don't want it for what it can do, I
want it because I remember reading about it, a decade after it was being
sold, and simply thinking it was a neat receiver.

A copy of the receiver wouldn't be the same, and is pretty inconceivable
given that there will be little demand.

I am conveying what I think about boatanchors, which may be wrong. But
I suspect you are trying to judge a market for such a rig based on your
own desires. If you think there is a market, you need to find those
people who would actually buy it, who actually do share your thinking
on the issue, to prove that there would be a market for such a project.

I still think that most people who pursue boatanchors are doing it
for nostalgia. A case can even be made that they long for simpler
days. But that doesn't mean that they want to give up bells and whistles
and modern designs on a permanent basis. I doubt newcomers to the
hobby are going off to buy that Drake 2B, they'd pursue it later as
another facet of the hobby if they do so at all (though of course
there was a time when they might have started with it, because it
was seen as a "novice" receiver or because it was available used
for cheap). I think most who go after boatanchors have more recent
rigs, and they use the old rigs in tandem, for variety.

What sort of volume will be needed to get the figures mentioned above?
At those numbers a run of a thousand kits will cost $192,000,
probably all up front.

In any case your margins will be quite thin and your hourly rate will
be thin as well.

By and large I stay out of politics. Hell, I don't even live
in America -- I live in New York City. But this "What have they
offered?" always bugs me.

"Offering" in this sense means a sound bite or slogan that
can be reduced to a media headline. Which is never the whole
truth and nothing but the truth. C'mon, Bill! I know you don't
really believe any viable solution to the problems of the modern
world can be reduced to 500 words or less. Any offered plan in
this sense is simply playing to mass sentiment, and bereft of
the details needed to make it work.

Now let's go get 'em! You know, THEM!!!

No, I'll be using Mexican labor for final assembly

>If I could build a Galaxy 5 equivalent in 20 hours...never mind...

No, this is not a Galaxy 5. This is a 21rst century transciever
topology
in glass that may deliver multiband audio/cw contacts at less cost.

>Okay. Paying shipping for one single returned rig in this scenario will
>have you WISHING you hadn't eaten last week's can of cat food for dinner.

Clearly I would have to reduce mass where I can. I interpret a
boatanchor
as meaning tubes as active units and mechanical tuning with a planetary
drive... I don't intepret that as meaning I have to use 50's-70's era
parts for
anything else or even point to poiint wiring. Maybe I can get the
weight
down to 15 pounds if I use aluminum for chassis and fiberglass or
carbon
composite for case.

>You couldn't do this for less than $500 per rig (sans
>labour and profit)....

Only I use parts from US and attempt to exactly duplicate a mid-60's
rig. If instead I can outsource nearly everything and never buy
retail,
and if I simply make a FET rig in glass, this might be less.

>and thats why there isn't the market that you imagine.

What I have to find out is determine how much someone is willing
to buy a glass rig for that delivers similar functionality as a 60's
rig,
and then determine how many people would buy for that price. At
that point, I have to work backwards to see if I can make parts,
labor, intermediate freight, and customs fees work inside the
interpolated wholesale figure.

So let me ask you... if you had the ability to buy a rig, in glass,
capable of 4 band operation where you could manually tune
and dip the amplifier, that gave you an operating range of 2000
miles on a reference dipole, AND it was built new, HOW MUCH
would you pay for that?

> Well said Mr. Liberal! Want to share the cat food?

I (and at least half the population of the US) am sick and tired and extremely offended by the right-wing, neo-conservative, propaganda slant that equates the word "liberal" with various *expletive deleted* words. Fact is, most of us are moderates. Extreme left and extreme right orientation is much smaller. Anyone with at least an IQ of 100 will look at both sides and draw conclusions from both. You neo-conservative bozos are going to pay dearly in the next big election. I classify my political views as "extremely moderate". I have voted for republicans and democrats based on their stance. Lately I tend to vote for democrats as a statement against the whacko neo republicans who have gained favor (for whatever unknown reason) in the last couple of years. Anyone conservatively oriented should wake up and return to real conservative political values and reject the "neo" crap and the "evangelical Christian" crap. Otherwise, you are going down!

I'm not going to read that gibberish. I was pointing the coward
comment at Peter and xranger. Look back at all the posts. This was not
a political thread until they started posting. If they want to start
OT political rants then they need to be prepared for comments. It is
as simple as that. I still say....let's go in with guns blazing and
finish the job.

The democrats used to be "hawks". Now the neo-cons are the hawks. What a change! Regardless, the outcome of the current war is very apparent. Traditional conservative political values have been hijacked by Bush II and his cronies. I am looking forward to the coming major elections. I think a return to bi-partisan, middle-of-the road, more sensible, politics will appeal to voters. That is, if the widely spread "neo" propaganda doesn't brainwash the majority. I prefer to think optimistically that it won't.

I'll take 250 words of anybody's mass sentiment pitch if they don't include worn out homilies that only mention bashing 'the Bush administration' and 'quagmire' as THE platform.
I don't expect any mortal to have the answers but I'd sure like to see someone who pretends to have a better option.

No one does...ummm, maybe because they know better. What if a major Dem were to surface and say "Lets pull out tomorrow, lock, stock and barrel. Let those bastards go thru civil war until they get their shit together". Now wouldn't that ring as loud a Conservative Bell as a major RePub saying "kill them all and let Allah sort 'em out" ?

Seems to be the same thing to me.

Waxing political, I happen to think the answer is dividing up the hellhole like was done in the Balkans because these factions just aren't gonna agree on anything as a whole. That doesn't prevent the nutty voluntary martyrs with a belt of explosives from doing their deeds - but at least it provides a mechanism for the US to get the heck out of there...which is now becoming more of a focus.

Maybe we are getting close. This summit in Cairo where the guys asked for a timetable for US withdrawal was a good sign. If the 'official' Iraqi gubmnit (FWIW) were to ask this we should assign another 100,000 troops to go over there and help the troops pack their bags and be out of there tomorrow. I think the Iraqi authorities are much more credible in that regard and see the extended US occupation as a problem rather than a solution.

Zeroing back to the point. Bush ain't gonna back down. He can't politically. Its up to you Dems to find some leadership to make this happen. So strap on a pair of balls and kwitcher-bitching and quit forking up uniquely Northeastern woosie french-fag-type candidates like Kerry and that high-school cheerleader guy from Vermont. Bush's satifaction rating is in the 30% range and I don't see any Dem capitalizing on that. Do you guys need a book or something?

Not for a buck an hour. Figure 4/hr for Mexican assembly labour but
you'll wind up doing this type of job on unit pricing. Add on about
15-30/hr on the stateside end to QC and align the works.

As a ham, anybody who tried to sell me with a pitch that suggested that
I could talk 2000 miles anytime I wanted to would be met with a red flag
in front of my checkbook. As for pushing the product onto other venues
like missionaries...maybe. There's probably a couple dozen brand names
that have gone down that same pike in the past 20 years and they don't
seem to have survived.

Ok, enough of the nay-saying. Suffice it to say you have no clue about
the costs of production or the market. You're infatuated with making a
tube xcvr for the masses on principle. That, in itself isn't a bad
thing. The results found along your route can ultimately be more
tangible than my opinions and a great resource for the next guy.

I might be interested in a 'Beta' rig for $199, post back when you get
there.

How many Dem-negative-buzzwords can I pick out of that post?

neo-cons
cronies
brainwash

I agree with your post but the parrot mentality is what keeps us from
accord. Whats a "neo-con"? Did this exist 10 years ago? No. How can
one make a cogent argument when the terminology suggests that the writer
has been brought up with accusatory spoon-fed terminology from one side
(or the other) as a means of making a point? What ever happened to
individual thought that wasn't influenced by campaign designer?.

Source record: 15061

After over ten years of restoring vintage radios, I am moving on to other hobbies (SWLing, woodturning and digital photography). I have a shop-full of test equipment available, including parts and a few radios. I would like to sell the entire shop as a package to someone who would like to begin the wonderful hobby of radio restoration, or who would like to expand their existing shop. I am not looking to "get rich" on this equipment, and am prepared to be very reasonable on the price(s).

If you are interested in this equipment, please drop me an email and I will send an Excel spreadsheet with the list and descriptions of the items.

Thanks,
Walt

The core, the essence of being a Republican is nothing which takes long to explain can be true (50 words is more like it).

You must hate America
You must hate freedom
You must hate our troops
Clinton lied
We are the only moral ones
Etc.

I do admire their ability to stay on message no matter what the cost. Everything must be cast in the starkest, most black and white way. I often play by the rule book myself now, as I have to agree the Dems just don't sound bite well enough without this approach.

I beg your pardon! You are the one that seems to have a grudge
against the world. You come storming into this group, asking for
opinions, and then get all huffed when the opinions you receive
disagree with your own.

You make political statements that are guaranteed to draw a heated
response, and then get all flustered when they do.

You complain about what a cesspool usenet is, and how this group has
no value, and then you start leaving your brown ducks in our pond.

I have been a contributing member of this group for 3-4 years,
but since your arrival, you have offered nothing of value to anyone....Nothing!

When I asked a simple question about a Swan 350 (knowing that there
were a few Swan 350 users on this group) you took that as an opportunity
to make derisive remarks about me owning a Swan.

Where are your posts with content?

Squire..

So far this is all mental gymnastics.

Why not do a prototype to prove and
debug the design, run it for several weeks to work out glitches, and
do one or two more test prototypes to finalize the design? This
will give you some idea on labor and material costs, and how much
time is needed to acquire parts... assemble... align and test.. etc.

I think at that point you'd have a better feel for what you are proposing.
One thing to think about: why not also offer a kit version? If you do
a magazine construction article, say in Electric Radio, that would
give you a "free" ad for the kit of materials, and some exposure.

Pete

And of course, it's all interrelated.

If one doesn't buy a lot of stock to begin with, then they have to scramble later to get suitable parts, and in the case of the mechanical parts, that may mean reworking the chassis. Which means if a large stock isn't bought in advance, then the chassis work can't be done in bulk, because that might mean the prepunched and drilled chassis have to be scrapped.

And if production has to stop while new sources are discovered, that may cause significant problems. That's why there's all those second sources for semiconductors; if a manufacturer can't count on being able to get those ICs on a continuous basis, they won't use the part.

I find it funny that you complain about the way conservatives try to
portray the word liberal and then you turn around in this posts and
your next post and do the exact same thing to the word conservative.
You are the reason I don't and won't vote for a liberal. You are
allowed all the negative rhetoric you wish to throw out but if someone
on the other side fires back you run crying to your mommy 'cause the
big bully is being mean to you.

Things have changed since the 'old' days.
You could perhaps sell a 2NT-like transmitter for about 500 bucks and make
little
profit, but not sure how big the crowd at the check out line would be.
Sounds nice though...but I think those days are gone. Unless you come up
with a cake pan thing such as had been done.
Or, take a look at doc bottleheads site at...
http://www.bottlehead.com/
No reason you couldn't take some tips from him, and make something with a
wood box, and a sheet of metal. Hit 'products' , then scroll to the right.
Some pretty nice shots, eh??

....Dave

I have managed to misplace the manual for my Kiwa MAP. Perchance is there someone who could copy/scan and snailmail/emaill me a copy? Happy to pay postage/copying costs, of course.

Thanks,
Walt

It seems to me that assuming the availability of the components (R,C & especially L and big iron) the next biggest headache associated with "building" a boatanchor is mechanical! Chassis, cabinets, front panels aren't ceap. How about offering "rebuild kits" for popular BA's. Something like a rebuild kit for a Johnson Viking with all new replacable components might be very attractive. Plus you could work the economy of scale by buying in quantity at a cost much lower than an individual could buy onesy twosy...

Just a thought... probably worth as much as most free advice!

Wouldn't the power supply for a 100-watt tube rig, alone, eat up much
of your cost?

I've built a number of solid state kits recently, and one advantage to
them is a simple 12-volt supply or wall wart is typically all you
need.

However, others in this newsgroup would obviously welcome the
death and maiming because of the economic activity (dollars going back
into the US) generated by it. How else justify the war on the basis of
the contribution to the US economy?

It is said that, had the Exxon Valdez arrived safely at its
destination port, it would have been a minor bump to the economy. But
by generating the spill, it made a much greater contribution due to
the billions expended in cleanup costs, lawyers, accountants, court
personnel, etc.

So maybe we should just destroy the rest of the world and
enjoy the economic benefts of rebuilding it.

By that standard, Katrina was the best thing to happen to the
US ecnomy this year. Right up there with the economic devastation
resulting from Enron and other cronies of the prsent administration.
The court costs alone for these events are staggering.

"Non- prop"? I guess that you can't see the big HP image that
flashes on the screen from the "Prop" HP BIOS when you turn the computer
on. I have a HP LX876 server with an ASUS motherboard. NONE of the
drivers are available and the hard drive is missing so that ASUS
motherboard will probably end up in the trash. Drivers for others in
that ASUS family don't work which is too bad because I really need a
working server for a local Veteran's information website project.

> Since I maintained computers for a living for over 30 years, I suspect I

I still repair a lot of computers, and some down to the chip level.
I replace defective caps on motherboards and clean up bad solder work on
some cards as well. I've been at it for 23 years and it has ranged from
mini-computers to embedded systems, and everything in between. The last
job I had before I was declared disabled was on telemetry equipment, and
some of those systems are in orbit.

You bet. They started out when some of the guys noticed brief point-source bright flashes
on the lunar surface. Used 80m to time whether the flashes were synchronized across
large observation distances. If they were not, then the flashes were likely meteors in
the earth's atmosphere; if they were synchronized, then the probablility that they were
associated with an event on the lunar surface was pretty high.

The guys had scopes setup in the backyard and 100-foot headphone/microphone cables
going back to the radio so they could observe and talk on the radio simultaneously.

They did reach a conclusion about the flashes....

Good point about the power supply. But here's a wild idea: what about
using a space-charge tube lineup. Now that could operate off 12V
(altho 5 AMP)! I
suppose I could also get a fair amount of output operating a mini power
pentode
in space charge mode in class E. Nobody told me that class E was only
for semiconductors!

Back in the car radio days transistors were the output of choice even when the rest of the tube lineup was space charge tubes. Can't get much power with that scheme. Not impossible for a QRP rig though!

From: David J Windisch <davidjw@cinci.rr.com>
Message-ID: <m_Dhf.233898$lI5.24894@tornado.ohiordc.rr.com>
Source record: 15089

Hi, all concerned:

For sale:

1. 80-10M Drake L-4B amplifier, sn 1010, Eimac tubes, pwr supply sn 1000, book, in good condition electrically; cosmetically, a few scuffs around the front edges. No issues with it; I simply got an amp with 160M. If you pick it up, I could demonstrate its 600W out on c-w and 1100W out on ssb. 10-day money-back warranty, provided it comes back in the same condition it leaves.

2. Meissner Signal Shifter exciter in good working and physical condition; 3.4-30 MHz, copy of book. I got it to drive a homebrew 4-400 to a KW on c-w, but that's not going to happen.

3. ESS TIME MACHINE: complete info at:
http://www.expandedspectrumsystems.com/prod2.html
I have band-filters and 9 different crystals for 40-30-20-15-10M, FLX-90, LO1 external-lo buffer, wall wart, all manuals. Got this for experimenting with homebrew software-defined-radio, also not going to happen.

4. Original service manual for Kenwood TS850SAT. Sold rigs; buyers didn't want it.

5. Before-MFJ HyGain TH7DX broadband tri-band antenna, good condition, original book.

6. Cushcraft 402CD pre-XM240 2-element 40M yagi, good condition, with CC 40M rotatable dipole I got to make 3L yagi out of 2L.

7. TMC IPA r-f deck, uses PL-172/8295A (no tube; same *socket* as 8877; chimney could have 4-inch OD-3-1/2orso-ID machined hi-temp non-conductive ring sitting on 8877 to cover over difference in tube diameters), 750pF Tune/1000pF vac variables with turns-counters in 2-30MHz bandswitched tank which has 3/8-in silver-plated conductors, 2 multi-meters, 6CL6/6146 bandswitched driver, no power supplies.

Pls make offers, and remember shipping from 45251. Antennas can be disassembled far enough to fit in those concrete-form tubes, for shipping. You know; those ones you've seen in bigboxhardware :o)

Tks for reading.

Forget about the split-clamp ferrites. Opt for the donut style torroid with a hole big enough to feed the fone line and connector and wrap at least 4 turns. This kept my 56k modem from hanging up when I was on 80 meters.

RF interactions are a fact of life and you need to know how to deal with it. Most are easily overcome, except for the irate person who would rather be irate than face it.

5204. GF-11 transmitter restoration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-25 23:04:10 UTC
From: Vladi <kb9olm@yahoo.com>
Message-ID: <1132959850.427209.104400@o13g2000cwo.googlegroups.com>
Source record: 15093

I am working on GF-11 transmitter restoration and having problems with CW keying (ON-OFF keying). The original design has provisions for MCW mode, but not for ON-OFF keying.

I tried various keying tricks with control grid bias and screen grid bias keying in output stage (pair of 837 tubes in push-pull), and the net result is small frequency shift of about 100Hz.
The original circuit does not have a buffering stage from oscillator output to PA input, and anything I do in PA stage changes the loading for the oscillator output, which in turn shifts the frequency of the oscillator circuit.
Any suggestions?

I also have one, or possibly two spare plug-in coils for GF-11 Tx, if somebody needs.

73,
Vlad, kb9olm (email: kb9olm AT yahoo DOT com).

How incredibly rude of "lazy"...I own a 350, love the radio...also own Icom gear...as for the antenna loading, you need to adjust it while tuining the radio but with as little power out as possible to save the finals from going soft on you.

Hi Steve,

Thanks for the info. The manual was silent on that issue. I was concerned that there would be arcing at the switch contacts if you switched live, so I would try one setting, key it, dip, and adjust the fine loading, unkey, and then try another coarse load position, wash rinse repeat... until I got the plate current I was expecting.

The Swan design was very competent, but very much driven by cost. That said, it is sort of odd that they used the fancy, but expensive, 7360 balanced modulator tube. I wish they would have used 6146's, but sweep tubes were so plentiful, powerful, and cheap back then that they probably were as good of a choice as any.

The drifting problems were the result of Swan's using a single conversion design. They used a band switched HF VFO to feed their first (and only) mixer. That decision saved them a whole bank full of crystals, and another conversion stage. It also reduced the number of conversion products (spurs) that were drifting around in the cabinet. But the cost was the introduction of that famous Swan drift to the ham bands.

Another cost reducing measure was to exploit the custom of USB on 20,15, and 10m, and LSB on 80 and 40m. Swan used hi injection for their mixer on 80 and 40, and low injection for the rest. That allowed them to get by with a single BFO crystal, and no USB/LSB switch. Hams didn't like that, so very quickly, Swan introduced a modification to add a third position to the REC, CW/SSB switch for "opposite sideband", and added a new crystal.

It's an interesting radio. It won't be my favorite, but I was glad to get a chance to experience it.

To those of you who were planning to join the AWA CW contest over the next two weekends be aware that it is a members only event. I just learned so today. Be careful not to intrude and work someone.(see emails below)

I will be testing out my new Hartley and look forward to anyone else (Member or not) who want to communicate with Old Time rigs.I will try not to intrude upon their contest frequencies

This is in no way a shot at Marc who was kind enough to point out the rules to me.

As a former (for no particular reason) member who has attended the Rochester meet I have listened to the complaints about AWA over the last few years and not thought much about them one way or the other. But I now do see why people complain that they act as an exclusive group.

Yes, I know I could join again and play in the sandbox the next two weekends, but to be honest I'm not sure I care to anymore.

From: Carl Nord [mailto:chnord@comcast.net]
Sent: Saturday, November 26, 2005 12:11 PM

Subject: RE: [AWA] Contest

Marc,

In all sincerity, thank you for the clarification as well as the others who were kind enough to fully respond to my question. There certainly were some rather unhelpful initial responses.

I will continue to finish my HB Hartley this weekend but will make sure (as a former member) that I abide by the AWA rules and endeavor not to intrude on the frequencies and work any of the AWA members.

That being said I will be on the air next weekend and perhaps some of the other non- AWA members might like to pick a frequency to exercise our OT equipment?

Hello all--

I've seen the recent queries posted about the AWA 1929 QSO party.

I guess I should jump in and try to clear this up, though I have no official connection with the AWA ham contests.

Our new AM QSO party, being chaired by Gary Carter, is the only one open to all hams. The other contests, including the 1929 QSO party, are open to members only.

The only reason you will find the dates of the QSO party on our web site is that we had to correct the wrong dates that were accidentally sent to the Journal and printed there. Frequencies, times, scoring info, etc are in the Journal but never posted on the site for obvious reasons.

Logs are sent out by contest chairman John Rollins only to previous participants or members who are newly applying for them.

Friends, this is a public service announcement only. I definitely don't want to get involved in discussions about the right or wrong of this, nor would it be appropriate for me to do so. Suffice it to say that John and the AWA have very good reasons for restricting the contest , though I can also see the other side of the questrion.

No. They were very succussful until another company who's name starts with a "Z" bought them out so that they could get a foothold in the home computer business. They ("Z") left Heathkit to flounder without proper finances until Heath closed. With proper finance and control a company could succeed with out much trouble. There are several "kit" companies out there that seem to be doing very well.

>I dunno, a company called Heathkit tried that and went belly up.

While that's true (and several other companies have ceased selling
kits), it seems they never charged anywhere near what an "unassembled
Heathkit" sells for now (factoring in inflation), as they're more
properly called collector's items, rather than kits.
I've had the thought of having faceplates and chassis made,
assembling the parts and offering 'kits' of some of the more desirable
Heathkit models. Much of the work, the actual design and the writing
and debugging of the assembly manual, is already done for you. I'm
unlikely to actually do this myself, maybe some others can run with
it.
There may be some copyright problems with the manuals, as well as
possible legal problems with copying the design. Circa 1996 I called a
phone number for "the real Heathkit - the only place for legal Heath
manual copies, still covered by copyright" that I saw in some
magazine, asked about a couple manuals (transmission tube testor, $25
at hamfest, metal dector $5 at yard sale), and they were $30 each. I
went ahead and got the tube tester manual.
But I wonder if there would be some interest in having boatanchor
'kits' available of some specific models that might be popular. Such a
kit would likely cost more than a completed original can be bought
for, but I can imagine that some people would pay extra to be able to
build just one more "Heathkit."
At the prices they go for, true unassembled Heathkits are real
collector's items and are unlikely to be built, as that would destroy
their (dollar) value, at keast much more so than building a 'copy'
kit. This way, one could buy a 'kit' for its original purpose, to
build into a working product.
While selling such a kit may have legal hurdles with copyright and
copying the design, you can build your own for personal use with no
such problems.

The OP wrote:

>based on schematics and design
>principles that have gone into the public domain.

Hmm, would this include the older (1950's) Heathkits, or has what
remains of Heath Company renewed the copyrights?

check the ham radio magazines and dealers; they carry the manually switched
coaxial switches.

I remember the GF-11, but not real familiar with it. It's similar to a number of military sets designed during the mid Thirties. And most often were of a simple MOPA (master oscillator,power amplifier) circuit.

With no buffer stage between the oscilator and final stage, I would think that it would be really tough to obtain a really clean CW signal.

I'm sure you're familiar with the ARC5 command sets of a bit later vintage. They were of the basic MOPA type. I recall that some guys claimed that they got clean keying by keying the PA screen grids and oscillator plate together.

Are you running the set from a regulated power supply? That might help.

For real fun, try to modulate the 837's. I'm sure you will wind up with an un-happy mix of AM and FM at the same time.

I ran MOPA Command sets in the Fifties, and always added a buffer stage (12A6 tube) between the osc and final. Mostly on 75 meter 'phone.

Are those 837's really in push-pull? Those small military rigs usually had parallel finals.

And bottom line, a hundred cycle shift to me sounds really cool and adds character to a transmitter from that era. Especially nice on Straight Key Night.

What is the oscilator tube? Maybe a triode like a 10,or something similiar.

I have a nice BC-230 transmitter of the same era, and I never even thought of trying it on CW. It uses triodes all the way through. A '10 driving a '10 with a pair of VT-25's in parallel as a plate modulator.

Thanks Chuck for the info on Swan. My dad bought me a 350 new in 1965 when I was 15 years old. Loved the radio even tho it did drift. I have one now and am having a blast working on it to modify and improve the drift problem that they all had.

Hi Carl:

The VT-127A is a good tube. It was a repackaged Eimac 100TL for radar use. Just more filament current. They were cheap after the war, but got sidetracked because the 304TL was also cheap and ran more power.

Love to see a photo when you get done as I have a few sitting in storage that belong in a rig.

As a market test, or "proof of concept," how about building a prototype and posting some photos, along with schematic & specs, for folks on this forum to look at?

Building a prototype would be a necessary first step in any case. And you might even get some useful suggestions from this crew, as cranky as they might seem :-)

Swan's answer to the drift problem on the later 350's was to put the transistor for the VFO (2n706) in a small box mounted under the chassis. They figured that that would keep it isolated from the tube heat. The best answer I have found is to turn the radio on at least one hour before using. That is easily done, as it often takes an hour of tuning around the bands before you are ready to start transmitting anyway.

According to trade journals at the time Zenith wanted to bid on a large computer contract with the US government, but they were not building computers yet. So, they bought Heathkit to get their existing government business, and to get the contract.

I've scrapped some of the "XT clones" from that contract and they were a joke. Both the regular and the "Tempest" hardware. I still have some of their "Z DOS" manuals and the printed source code for the BIOS used in the computers. Zenith put the non Tempest version in the Heathkit stores, and a board was sold by a third party to let you run MSDOS software on the system. The I/O ports were in different locations from the standard "XT" design and some of the BIOS calls were different so that the software written for regular "XT" computers wouldn't run on their design.

Whatever Zenith wanted to do with the company, I don't think it's that
simple.

Circa 1976, Heathkit had to recall a 2M transceiver (I think it was
a handheld) because it was generating spurs, I think in the aero band.
If I recall, it wasn't that it couldn't be a clean output, but that
it couldn't be clean with the equipment the average ham had. So they
called them in, and eventually came up with a new design.

As times went by the equipment became more complicated. And then
it became harder and harder to make them something that anyone could
build. If in the fifties they'd sell a shortwave receiver kit with
the coil slugs "pre-adjusted", a couple of decades later they'd be
selling a kit that had some crucial circuitry in a preassembled module.

Over that same period, they'd be selling tube gear that was well
oriented towards hand wiring (so it made little difference whether
it was wired in a factory or by the end user) to solid state devices
on circuit boards. The latter was more conducive to automated manufacturing,
and the moreso the more years that passed. So the cost of manufacturing
went down (I got my DVD player two years ago for fifty dollars, and that
is far more complicated a device than any Heathkit till at least the
mid-seventies if not later), while the overhead of making something a kit
stayed the same or more.

Remember, Heathkit did not cater to the hobbyist, even if they were
among the customers. Heathkits were intended to be built by anyone.

And they were seen as a way of getting something a bit cheaper if you were willing to put some time into the project. As time went on, the automated manufacturing and one assumes overseas manufacturing lowered the cost of manufactured equipment. A color tv set was still a relatively major purchase forty years ago, while today if someone needs a tv set they just go out and buy it that day. There became less interest in building the kit except by a relative handful of the population. I would think the mass consumer items, the tv sets and the Boonie Bikes and such, helped to subsidize the amateur radio equipment. If Heath had to live off the profits from just the ham equipment, they wouldn't have lasted so many decades.

But towards the end, they had really complicated equipment for sale to hams, and likely the "kit building" of those required less time by the builder than the old gear, and it was expensive. Heath had become less of a common name, and it seemed like the later catalogs were slimmer and less interesting than a couple of decades before.

Combine all these, and the kit business as done by Heath couldn't survive.

The kit companies that have come along since, they cater to a much more limited market. They cater to a hobbyist crowd, and while they may need handholding, one would hope not as much as someone walking in off the street who's never soldered and wants to save some money by building that color tv set. Heath spelled out everything in their manuals, while I suspect many of the more recent kit companies say things like "stuff the board, solder the components, and then turn it on" (not so brief, but not nearly as specific as Heath). That saves money. And if you sell products where the kit building is as important as the end project, ie a regen receiver kit where someone can have fun building it and can have fun playing with something new, but who doesn't expect to use it as a main receiver, then you are dealing with a different market than Heath, where they were selling the end items and they had to have a transceiver that was competitive with what everyone else was selling, be it the HW-100 in the late sixties or the Yaesu or Kenwood lookalike that was sold towards the end of the company's life.

But it wasn't Zenith that killed Heathkit. Zenith liked the computer
business, and also liked selling TV's, both kit and non kit through the
Heath distribution system. For them, the kit division was like a stock
that pays dividends... money for no effort.

The death knell for Heath was sounded when Group Bull, a french conglomerate,
proffered a takeover bid for Zenith. Bull was interested in the highly
regarded Zenith laptop computers. Bull had absolutely no interest in the
kit company, so they stripped it of everything that wasn't bolted to the
floor, and sold it to itself, and mere shell without any solid assets...
Lots of IP, but no money, or stock, or supplies, or fixtures to use in
manufacturing.

Given that Heath was essentially gutted, fileted, and hung from a hook in
the meat locker, it is pretty amazing what they have done with themselves.
They still sell manuals for all of the gear that was sold before, and they

are making kits and educational trainers. Plus they have a fairly highly regarded business in the home security and lighting industry. You can even buy their products at Home Depot.... it takes more than a little bit of "juice" to get shelf space in Home Depot.

I have a couple of 100xx also and some tunning capacitors and coils and
transformers etc.
I have been keeping these for an old time rig that probably will never
get built.

Anyone want to build a tube rig? I already have too many projects.

That's the sheet-beam tube? Those things actually reduced the cost of
a design because they eliminated a whole slew of parts. Later on there
were a bunch of cheap ones designed for chroma detectors in TV sets, but
at first there was only one.

I want a small standalone QRP SSB transmitter based around one of the newer
PLL chips. I want a row of five thumbwheel switches that I can set from
say 500 KHz to 30 MHz, a switch to select USB, LSB, or CW, and maybe a
watt or two out.

THEN, I'd like just the PLL section out of it, to use as a VFO on older
rigs.

bought a dx-394 from david munro of keene ontario
never recived it.two months now.
paid with international postal money order and he cashed it,wont return
calls or emails.
beeware of
david munro
220 paudash rd
keene ontario canada
kol-2go
any ideas on how to pursue this further?
thanks jack

http://groups.google.com/group/ont.forsale/browse_frm/thread/9ca11547b5d02a35/b5e11f7f8947848a?lnk=st&q=david+munro&rnum=9&hl=en#b5e11f7f8947848a

It appears you aren't the first to be ripped off by him. Just do a
google groups search on him, he has been busy for years.

I've only heard of them being used because of their extremely good carrier suppression. They provide on the order of 60dB of carrier suppression, as compared to a typical balanced modulator which gives only 30dB. When used in conjunction with a crystal, or mechanical filter, the 7360 can achieve 80dB of carrier suppression.

I can see that they would provide some reduction in parts, they are capable of oscillating, but Swan didn't use it that way. I think they could have achieved a greater cost savings using 4 matched diodes in a ring modulator configuration.

Gather all evidence of the transaction.
Contact the RCMP in Canada and in Ontario
Province. They may go after him.

Had a similar thing (a bounced check, actually) with a guy in another city
in Ontario. I sent an email to the police chief in his city, who apparently
called him and 'sorted it out' - I did eventually receive my money. As
Keene seems to be a suburb of Peterborough, ON. you might try: (
http://www.peterboroughpolice.com/).
YMMV of course.
Good luck. Haggis.

It never ceases to amaze me how many times people come here to post "beware" messages but didn't take the time to
search for them before blindly sending money to a stranger.
Not that it's foolproof, but one search would have saved the trouble in this case, several times over.
Sorry for your loss and wish you well in the recovery. Getting ripped sucks.

Jack, the best advice is contact the local RCMP office in that area and ask how to file a complaint. Before you do make sure you have a copy of the postal money order showing that he cashed the money order. If you purchased the money order from the US Postal Service then you should also contact them regarding mail fraud. They may refer you to the Canadian postal service but who cares as long as you get someone to take action. Do not let it drop as someone else will get ripped off next. Let us know how you make out.

As I understand things, the fraud only becomes postal fraud if the order was placed by US mail. The order was placed over the internet, and the postal transaction was simply: you mailed a money order, he received a money order. Nothing fraudulent about that.

Money orders are a very bad deal for the purchaser, and a very good deal for fraudulent sellers.

> $199.95 it if offers compareable features.

Wow, pie-in-the-sky pricing!

My guess is that if you wanted to replicate a mid-60's vintage Swan 350 from scratch (but using actually obtainable final tubes rather than sweep tubes) you'd be looking at several tens of thousands of dollars in up-front tooling and it'd cost about $2000 or $2500 for each one you produce.

They listed for $420 (just for the rig, add on more than a hundred more for VOX, speaker, power supply) in 1965. They had a good run, and a decade later were being offered (with some updates) about a decade later when they stopped selling them because at that price hardly anyone was buying them. What makes you think that the sheet metal, transformers, parts, etc. are going to be cheaper today?

Producing it in China might let you sell it at a less-than-$2000 price point.

If you're looking to do a Collins-class rig, you'll never get the extra $ for the effort because it's still "not a Collins", and even at overinflated E-bay prices the Collins rigs will still be cheaper.

Tim.

Incorrect: If someone is cheated, it is fraud. What you describe is illegal. Whether a small transaction will be prosecuted has to do with how overloaded the police department is. There are obviously other problems, since you are a witness and not local. But, simply because someone is not prosecuted does not make it less fraudulent. Posting an item for sale and receiving money for it in any form without the intent to perform is fraud, pure and simple.

I gather this was not an ebay deal. I never do any deals via mail on
used gear that doesn't have some sort of auction house in the middle.
There are plenty of jerks who read usenet, figure out what is a popular
item and then pretend to have one for sale. A DX394 or Sony 2010 would
be prime bait.

Doesn't matter. Several years ago I had a scumbag in Conn. rip me and I paid with US postal MO. The post office had me fill out papers etc.. They never did anything and I bugged em about it for two years, nothing! I went the whole wrought and reported it to Bridgeport police filed every complaint in the book, nothing. And they wonder why people take the law into their own hands.

I didn't say it wasn't fraud! I said it wasn't *postal fraud*. It was internet
fraud, and that is not handled by the postal police. That a money order
was used for payment is immaterial.

It is a shame that you aren't experienced enough to know that postings don't arrive in the same order everywhere that they arrived on your Outhouse Express screen.

If you want anyone other than just you to understand your silly assed comment, you are going to have to quote the article you are commenting on.

I suppose you can consider it most anything you like... What the law considers it is probably an entirely different matter.

The internet confuses legal issues quite a bit. A posting that started in NY, and was read in LA might very well have traveled by way of Canada, or Mexico, or satellite, or Nigeria, or timbukto ... It could also have traveled over the phone lines, cable lines, through the air as wireless traffic...

Is the crime interstate, intrastate, federal, telephone, cable, or international?

Huh... I have had bunches of dealings with Canucks.
Well at least from Ontario. Every deal has been great.
Good equipment, good deals - oddly enough all TMC gear.
Great Hospitatlity,
Heck, they even have a cool national anthem.
I would say they are good neighbors indeed.
One word of advice : NEVER drive through Toronto during any part of the day.
It is constant grid lock.
Any night you cant get from Ajax to Niagra at blazing speeds.

I don't about Quebec though - I hear they are a little loopy there.

>M II - I understand that 'you' Kill Baby Seals for Free ~ RHF
> .
> .
> . .
It has been illegal (and there is therefore no market anyway) to kill baby seals for many years now.
However organisations such as the IFFAW still use 'old footage' (Well, of animals anyway) cos Bridgette Bardot, once pictured cuddling a wild live seal pup, is much older today! For fund raising.
And the debate continues, despite millions of seals on the North East coast of North America each year. Less depleted than the once plentiful North American buffalo are now.
For fishing peoples the seal 'fishery' was once an essential part of surviving through the end of the harsh winter season. It was an intensely dangerous activity that could bring in some, often essential, income at a critical time of year, before fishing could be recommenced. It was 'prosecuted' as the expression used to be, typically out of New England, Nova Scotia Canada and from Newfoundland (now part of Canada) and Greenland etc.
With the debate/controversy, fact/fiction? about 'Global warming' it may become less common. If global warming is true, without sea ice on which seals can 'pup' (i.e. give birth their young) vast seal numbers will decrease. Kinda unkind to be drowned at birth eh?
In the last few years good quality seal pelts have risen in demand and in price. Some people who live in cold wet, icy climates prefer sealskin clothing in preference to say, less waterproof, sheepskin/leather. But sealskin is also used for very fashionable items. And for durability; one will rarely wear out a sealskin hat or boots, for example.
Beware of misleading (anti-sealing) advertising! To paraphrase Hitler; who once said "To tell a lie. Tell a big one and tell it often". The sealing season is brief and highly regulated. My late neighbour VO1HI, also a licensed marine radio operator, once took part of his vacation as radio operator on one of the traditional style sealing vessels which went to the ice 'front' to get seals pelts, seal carcass meat and 'flippers' which properly prepared are still considered a delicacy in certain areas.

That is reasonable enough to erase his entire family tree for a few hundred bucks.

That would be fairly effective assurance that the problem won't grow any larger from his gene pool.

Hi JWB,

Sorry about your misfortune.

I'm curious...How did you come into contact with him in the first
place? Did you see an ad he put on a message board? online
classifieds? magazine? email reflector? usenet?

LOL, you're correct.... it really doesn't matter.
Had a rockhead try to take me for $3500 outta NY a while back... deal over the internet, cert. bank check,
and it went from local cops to county to state to Atty. General to United States Postal Inspectors....
last thing I remember being told by the trusty Package-Police... "You must realize we have million-dollar frauds on our desk, but we will
look into it as soon as possible." and as far as I know, it's still on his desk.... I gave up on the system [will never use it again]
and just hounded/tracked/harrassed/called/fax-bombed/email-bombed the living crap outta him, his neighbors and everyone he knew for
nearly a year straight, and finally someone had enough and gave up one of their wives and where they worked.....and I called there.
WOW.... I had my money coming back to me
in timely payments over about 4 months and even got a couple hundred for the "trouble".
[it all came in money orders from different people and places, but who's complaining...]
Something about losing his Correctional Officer job and her job with Ingersoll-Rand just lit a fire under it.
Maybe one day I'll even let the package-police know what happened.
Almost 2 years lost, screwing around with morons. Puerto-Rican mafia morons no less. [no offense to PR in general]

The system only works for the few, and only in a 'right place/right time' manner.
Wish him luck!
rb

I recall 3 or 4 years ago, some outfit or guy in Paris, Texas was
selling a newly manufactured Globe King 500 for about $7500 -- with
money paid in advance before building the rig. They ran a few ads in
QST, then I never saw anything of the rig again.

My first commercial radio was a Howard 435A. And, it came without a bottom plate.

Your offer is 45 years too late.

The paint was crap, so I repainted it red. I still have nighmares over that. It may have been the worst thing I have ever done. Do not ever paint a radio red.

5267. Hallicrafters SX-42 tuner lock mechanism (how does it work)?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-29 02:31:52 UTC
From: Phil Nelson <philnelson@nospam.xyz>
Message-ID: <pomdnfoAsdwCIBbenZ2dnUVZ_tydnZ2d@giganews.com>
Source record: 14956

So, this guy emails me a question asking about missing parts on the end of the tuner shaft, involved in the SX-42 tuner locking mechanism. I remembered that I have a junker SX-42 chassis in the garage, so I took a couple of photos (sorry for the blurry one -- it's an auto-focus camera).

http://antiqueradio.org/art/temp/SX-42Brake1.jpg
http://antiqueradio.org/art/temp/SX-42Brake2.jpg

I thought I understood how this worked, but it's 10 years since I rehabbed my SX-42 and I never paid much attention to it at the time. The junker tuner is frozen and missing all knobs, so I can't twiddle things around and experiment.

From the looks of it, the two "wings" toward the left of the first photo can grab one of two "rotors" on the shaft. A spring between the ends of the wings pulls them together (second photo). In one position, the wings would grasp the left rotor and release the right one, and vice versa. There are "brake pads" for the right rotor.

Question: how does this actually work?

When you rotate the little winged lock knob on the front of the tuner, does that make the stuff on the far end of the shaft pop in and out, to engage and disengage the right stuff on the far end of the shaft?

All hints appreciated.

P.S. Don't freak out if you see non-stock components in other parts of the photos. This chassis was stripped to death by a guy who installed PC boards and other solid-state stuff to make a homebrew HF receiver.

There are bad guys everywhere -- Canada is no exception.

The way to handle this case is to send the person a registered letter and
indicate that if he does not respond, you will report him
to the Fraud Division of the Ontario Provincial Police (OPP). That should
wake him up a bit!

Have a look at: http://www.crimes-of-persuasion.com/Victims/reporting.htm

I haven't had a problem with Canada. However, I dedicated a webpage to
this jerk
http://www.lazygranch.com/cozzi.htm
I put the URL in his feedback and he managed to get the feedback
removed. I hadn't realized it violated ebay policy.

I had another asshole who sold me a camera that needed repair and
decided he could stand the negative feedback. However, he might have
not known the item was defective. This Cozzi character sold me shit.

Well, I was thinking of general design principles cleanly rendered into glass, not necessarily of creating true replica equipment.

There are actually a few modern day princples that could be rendered into glass. One of them is the class-E RF amplifier. It would be very nice to get 50 watts out of a triode mode RF pentode by wiring it the same as a MOSFET.

That's really not what I want to do anyway. I don't want to build a
true replica transciever. I was only intending to make a clean,
rugged, glass transceiver that has a 60's to 70's interface. Big
difference, I think.

>What makes you think that the sheet metal, transformers, parts, etc. are going to be
cheaper today?

Because they were made from America with union labor.

Hello all,
I hope someone can help me on this one. So the story goes....last night I pulled a rusty tuning cap sub chassis from a Halli S19R. Cleanup up really nice. When I went to remount the tuning cap, snap go the threaded shafts that go from the bottom of the cap to the sub chassis. Brittle doesn't even describe them. I was being careful. The feeling I had was close to the feeling one gets when cleaning an old glass dial and wiping away the markings. I went online and found out that the name of those screw goodies is a spade bolt and a co. that sells them has a min order of $40 for 100. (I need 3). They consist of a 6-32 threaded shaft about 1/2 in long and a flat top that spreads out alittle (where the flat goes lengthwise to the screw thread) with a hole in it to rivet to the var. cap. By any stretch of the imagination does anyone have any of these gems that I can purchase from you or know a source to refer me to? Thanks in advance, Mike KF6KXG

Ouch!

I have seen these in hardware stores from time to time; you might look in your area. If you don't find them, then J&E Fastener on SE 59th St. in Oklahoma City has an enormous inventory, and I've never come away from there without the fastener I was looking for. They do have a minimum order of $10.00, so you might as well stock up on other stuff when you place the order. They're in the phone book and have a web site, too: <www.jandesupply.com>.

J & E Supply & Fastener Co., Inc.
1903 S.E. 59th Street
Oklahoma City, Oklahoma 73129
Local: (405) 670-1234
Toll Free: (800) 677-7922
Fax: (405) 672-7756
E-Mail:Sales@jandesupply.com

I don't even know people there; my only connection is that I go there when I need something, give them money, and walk away happy.

Squire,

You really have got to learn how to quote the article you are
commenting on. The articles appear in differing orders in
each person's news reader.

Not even the person you are responding to has a clue who you
are responding to.

Thanks for the tip. The SX-42 Dial&Gear DJVU file at BAMA gives me nothing
but the boilerplate "this came from BAMA" end page. Perhaps a faulty upload?
I have no problem getting other DJVU files from that site. I have all the
other docs, which say nothing about such mechanical details.

Regards,

Phil

That was an extremely common choice for not only for not only transmitter balanced modulators but also for receiver mixers and product detectors in the 50's and 60's. I think it must've been the case that one early ham article used it and everyone else copied it. Certainly it was not a common junkbox part...

Hi Tim,

ARRL published a circuit using it in many of their handbooks from the '60s. And I have heard that it was used in TV applications, but the part that surprises me is I have only seen one type, the 7360. If it was such a commonly used tube, it surely would exist in a non industrial numbered version (eg. 6ZZ9, or some such).

The reasons for wanting such a tube are easy to figure out. It can easily give 60dB of carrier rejection... add a xtal filter, and 80db is easily achieved. Compare that to a diode dbm, and its 30db, and 50db capabilities.

Boy, this is a good test for many of us. I have some stored somewhere and will look. However, it is not a part that I have "catalogued", since I never need one. So, the question is where are they located. Will check tonight. I know I have a few dozen around, and when I see them I wonder what I am going to do with them.

Hopefully you will not be inundated with 7,000 of them, but will get at least a few. Feast or famine.

Hay! I used to have one of those. It's a Motorola VHF Police receiver.
They used to be called "Bread Box" radios since that's what they looked
like.

I paid $50.00 for mine at a hamfest about 40 years ago. Threw it out
even though it was still working.

Not me! They used to slip stuff like that into the back of my step
van when i wasn't looking.

On the other hand, I will admit to picking up over a ton of old power
and audio transformers after a Dayton hamfest in the early '80s. I
sorted out the junk and stripped it for copper, but I saved a few good
cores to wind new transformers.

5307. getting bit by my FT-101EE chassis

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-11-30 05:47:59 UTC

All,

I don't know if I am grounding my station correctly.

The radials of my 20m vertical are connected to my trailer's electrical system ground rod. My coax shield is connected both to the radials and the ground rod. I plug my antenna into the Yaesu and turn it on. I can hear stations just fine, and I have no problems touching the chassis. However, the instant I disconnected the antenna but hang onto the coax, I got a mild shock on both arms if I should momentarily touch the chassis of the Yaesu. So, I understand I have a problem.

Now I noticed that the Yaesu uses a 2-prong AC cord adapter, which is "before code" and therefore is unsafe by today's standards. If I rewrire the AC cord to 3-prong, should that remove the hazard? If so, what pinout do I use? The FT-101 Shop service manual does not list where positive, negative, and neutral should be on the Yaesu power plug.in Figure 1-2.

Thanks,

The Eternal Squire

P.S. I hope I have not long-term defibrillated myself. Should I visit a hospital for cardiac system damage even if the shock was mild? I now realize that I probably could have been killed. Right now I have everything unplugged and disconnected until I can get better advice.

You should probably connect the rig (chassis/cabinet) to your ground system somehow. Is there a grounding lug provision on the rear of the chassis itself?

3-wire cord should do the trick - *IF* your trailer electrical ground is connected to its frame, etc.

Years ago I had a FT101B try to kill me.

I had the system grounded, but it was a minimal ground. The transceiver was about 50 feet to the East of the service entrance ground. The coax tied to a 40 meter vertical out into he west yard which was about 100 feet to the west of the service entrance. There was a single ground round and a number of bare #10 radials tied to the ground rod.

It was spring, the snow had melted and the ground was wet and soggy. One of the radials had come loose and curled up around the base of the antenna, so I picked it up, pulled it straight, bent a kink in the end to stick in the ground. I knelt down to stick that end in the ground. When my knees touched the wet ground that sucker didn't tickle, it grabbed me and held on *really* tight.

I fell backwards and when I went over backwards my knees broke contact. I threw that wire as hard as I could under the circumstances.

I brought out my Simpson 260, stuck one probe in the ground about 6 inches out from the ground rod under the vertical and stuck the other probe in as far out as I could reach. I measured 90 volts with that VOM across about 5 or 6 feet of wet top soil.

A close inspection turned up a liberal solder joint at the power connector on the back of the rig (inside) which under the right conditions could contact the chassis. The cord was one of the un polarized type.
It passed plenty of current, but not enough to trip the breaker. (this was before the days of GFIs)

I removed a bit of solder and never had another problem with the rig. Actually, I'd like to find another, nice, clean, FT101B to recreate my old station, but I'll never forget that one.

A three-prong plug will make the radio safe, but in fact as long as
the radio is plugged into the antenna, it's already safely grounded
by the anntena system. A three-prong plug will make it meet code,
though.

BUT, the real problem is that you have current leaking to chassis, and
your chassis has become hot. Look for an AC line filter or some
ceramic disc capacitors between the AC line and the chassis, used to
keep RF out of the power line (and out of the radio). It will be
leaky. Replace it, even if you think it's good.

>P.S. I hope I have not long-term defibrillated myself. Should I visit
>a hospital for cardiac system damage even if the shock was mild? I now
>realize that I probably could have been killed. Right now I have
>everything unplugged and disconnected until I can get better advice.

Keep your left hand in your pocket next time.

The thing about electrical injuries is that there is really nothing doctors
can do. When there is damage due to electrical power, cells become
elongated and the cell membranes break down. As this process continues,
the cell membranes break, the resistance of the tissue drops, and more
and more current flows. All the doctors can see is the surface burn,
they can't tell how bad the tissue damage is. So even in the case of
very serious electrical injury, the normal procedure is basically to wait

and see how much tissue dies. RF burns really terrify doctors, because they look like serious electrical burns but have little or no actual tissue damage (due to skin effect). So they look a lot worse than they really are.

Chuck,
There was never a pin-for-pin "entertainment" version of the 7360,
but there were a few functionally-equivalent types, the 6AR8, 6JH8,
and maybe another (6M-something) I can't remember. They could be
used in the same circuits as the 7360, and they were cheaper
as they were made in much larger numbers (Zenith used the 6JH8 in
color-TV demodulator circuits). And they were used in ham gear
too -- my old Swan 260 "Cygnet" used a 6JH8 as the balanced mod.
These tubes did make great balanced modulators, and nice receiver
mixers too.

The schematic IS on BAMA. I just downloaded it to be sure it was good, and
it's excellent.

The format is djvu, and if you don't have the djvu reader you can download
it free. I don't have a format converter for djvu so I can't reformat it
for you.

If you are unable to use djvu and don't get other offers, I can take screen
snapshots of the schematic image and save them in whatever format you like
and email them to you.

Let me know.

Don

Hi Ted,

Thanks for the info. I thought I knew my old RCA RC-25 tube manual
pretty well; I bought it new, and the binding has all fallen apart,
but there they were just like you said.

I must have stopped mucking around with tube color tv's before they
became popular.

Subject: Dave Munroe Scammer of Ontario Canada back at it!!!
Reply to Author | Forward | Print | Individual Message | Show original | Remove | Report Abuse

If your contacted by this guy or see a post from "homesteaders2...@yahoo.com" or "Homesteaders2...@yahoo.com" don't deal with him!!! He had a low profile for a while, but he's back at the scamming.

Most Current info is:

Dave Munroe (doubt if that's real)
220 Paudash Road (doesn't show up on Yahoo Maps)
Hiawatha, Ontario, Canada K0L-2G0 (Again, the city of Hiawatha doesn't show on Yahoo, and this is a new city compared to his old city of Keene)
Cell phone (yeah right) is 705-313-1518

Mail is beginning to bounce to the lower case homesteaders2...@yahoo.com. My most recent email from him was dated in mid-May in which he claimed that the mail is slow.

He currently has several ID's still active on Ebay of "leanna2000", "-pokey-", "Quake99" and "Invest7". All have 0 feedback's but ebay only goes back 30 days for history now. So information is skimpy.

If the radio has bypass caps on the line to chassis, and many do, you can develop sixty or so volts AC from chassis to ground because the two caps form a voltage divider. Measure the DC resistance between each of the power lugs to the chassis, you should see infinite resistance. Don't relay on the coax shell to provide a safety ground, you're only going to end up getting knocked on your butt repeatedly when working on the rig. The best bet is a three wire cord with safety ground.

This is indeed the case for the FT-101E whose schematic I just examined. What I did was remove the 2-wire cord, and then connect a 3-wire cord where plus and minus hot were in former locations, then soldered the neutral wire of the cord to the plug's ground pin. Hope that would work. The voltage divider effect bears out in the fact that my original exposure to the AC was not immediately fatal.

I think from now on, I should NEVER operate a rig powered by a 2 wire cord.... I should always replace with 3-wire on general principles.

The Eternal Squire

NO! Don't do that! The hot goes to the + hot, and the neutral goes
to the - hot, and the green wire goes to the chassis.

Never, never, never connect the neutral and the green wire together!
(Did I mention never?)

The only place in the whole house where that is supposed to happen is
in the service panel where the power comes into the house. Everywhere
else, it must remain separate. The bond wire (green) is purely for
safety. It saves your butt when currents accidentally leak out to
the chassis. If you have the bond connected to the neutral side of the
powerline, it can energize the chassis in certain wiring failure modes.

Please don't leave it that way, save some poor soul's bacon, and go back
and fix it correctly.

Thanks,

-Chuck

I believe the important thing here is that a three wire plug be used and
that it gets wired correctly. I will never see why the neutral which is
grounded and green wire which is ground cannot be tied together. The
key here is that the plug can not get reversed like it could with the
two wire plug so getting hot AC on the chassis can never happen. If the
socket is miswired than as soon as you plug in your radio with the green
and neutral tied together your main fuse will blow. I sure would like to
know what certain wiring failure modes could energize the chassis ?
Ground is Ground period. If the original two wire plug would have been
polarized in the very beginning I expect that three wire plug would have
never happened.

No, not really.
You're thinking like an electrician saying the chassis is energized.
That can happen too in a failure mode but the original poster's gist was
that he got that normal low ma bite that one gets when one creates
different ground points as opposed to a common ground.

The answer here is to tie the grounds together as short as possible. Of
course the OP is going to get a tingle when his rig is 'grounded' only
via the AC with inherent leakage of caps/yadda/yadda versus his external
antenna/trailer ground. Thats normal.

Sorry to belabour but this has been addressed in most every electronic
publication since electricity was 'invented'.

I could ground all my stuff to the hilt but you would have to pay me to
pound a separate ground rod and lick my fingers and put my hand between
the rig and the new rod. Ground ISNT ground unless they are at the same
potential.

If OP wants a no-bite situation he should visualize the ground path via
his coax versus the radio ground via the trailer AC wiring. Until the
two are essentially the same a difference in potential exists.

Yup, as I said when in the earlier post where my FT101B tried to kill
me with a bare copper wire tied to a ground rod.

Hi Ron,

You are thinking like a newbie engineer... you haven't yet discovered multiple failures, and mistakes. If nothing fails, you are right, there is no harm in tieing the safety ground and neutral together.

But let's first discuss the purpose of the safety ground: It is there to make it very unlikely that the cases of appliances could ever become elevated above earth ground. This is to protect a barefooted doofus from getting electrocuted when he is standing on the cement floor in the basement, and trys to operate his FT-101E. The *secondary* purpose of the safety ground is to provide a return that will blow the circuit breaker if the hot lead accidentally becomes shorted to the case of the FT-101E.

The way the safety ground provides these protections is by being connected to the centertap of the pole pig (neutral), and to a grounding rod that sticks into the earth at the house. This connection is done at the service panel where power service enters the house. The grounding rod is there to make sure that the safety ground, and thus the cases of the appliances, stays at the same potential as the cement floor in your basement.

Back in the old 2 wire days, when the neutral side of the plug wire was connected to the chassis, and you were expected to turn the plug around until it didn't tingle, if the cord's neutral wire broke, current would pass through the appliance's circuitry to the chassis connection, and as a result the chassis would become hot relative to the earth ground (Doofus's feet on the concrete slab). Doofus would be pushing up daisies.

Let's move forward to the days of the 3 wire plug, and the safety ground...

Saint Chuck has wired Doofus's FT101E so that the hot lead goes to Hot+, and the neutral lead goes to Hot-, and the safety ground lead goes to the chassis:

Doofus, likes to unplug his FT101E whenever he isn't using it, and he likes to windup the cord to look just like it did when the radio was new-in-the-box. After doing this for a while, the hot, or neutral lead breaks. Doofus plugs in his radio, and turns it on, and it doesn't work! So he asks Saint Chuck to fix his radio, and life marches on. If, on the other hand, it wasn't the hot, or neutral lead that was broken, but rather it was the safety ground lead, Doofus wouldn't know it was broken, and would continue to operate, a little less safe, but still safe, because the radio was wired correctly... and if somewhere down the path, we added an additional wire to the broken safety ground, the radio would stop working, but would still be safe.

Now, lets suppose that instead of Saint Chuck wiring Doofus's FT101E, it was wired by some squire. This squire wired the hot lead to Hot+, and then wired the neutral lead, safety ground lead, and chassis to Hot-.

Back to Doofus:

Doofus, likes to unplug his FT101E whenever he isn't using it, and he likes to windup the cord to look just like it did when the radio was new-in-the-box. After doing this for a while, the neutral lead breaks. Doofus plugs in his radio, and trys it out, and it works just fine! Doofus continues operating this way, and eventually, another wire in the cord breaks. If that wire happens to be the hot lead, the radio will quit, and barefoot Doofus will take the radio back to the squire for a rewire job. If that wire happens to be the safety ground lead, the chassis of the FT101E will now be at full power line potential (current passing from hot lead through the radio's circuits, to the chassis/hot- connection), and barefoot Doofus will be pushing up daisies.

The safety ground must NEVER be connected to the neutral at the load! NEVER!

Be safe, allow for multiple failures, and fix the cord so that the hot lead goes to hot+, the neutral goes to hot-, and the safety ground lead goes to the chassis.

OK that is one case where your need two failures to cause a hot chassis.
Now for Doofus to get electrocuted he will also have to have one
hand on this deaf radio and one hand on the radio that has a metal
chassis that is plugged into a socket with a good ground. The problem
you could also have a similar problem even if the neutral was wired
correctly (not tied to ground). If the ground wire broke in the cord or
inside the radio and then a capacitor or a transformer had an internal
short to the chassis or there was a resistor from hot to chassis ground
then the chassis would become hot. The so called safety ground is not a
100% sure thing in the case of a failure. Because safety grounds are as
prone to fail as anything a third external wire tying all metal cabinet
radios together is the only safety measure if one has a table full of
these old AC powered beasts.

Yes it is not a good policy to tie the ground and neutral together. I
just felt that a good explanation of why not to do so was required
instead of just a blanket statement stating "The safety ground must
NEVER be connected to the neutral at the load !NEVER! "

But he on the safe side and ground those boatanchors together. (you can
buy a bigger boat that way).

Thanks
Ron WA0KDS

He won't know the radio is "deaf" until he trys to turn it on... and you know Doofus, he broke the on/off knob years ago, and he always turns the bare aluminum shaft while he is standing barefoot on the cement floor.

The problem you

Nothing is ever 100% perfectly safe. But you do try and improve the odds as much as you can comfortably afford. Adding a safety wire system gives you much more bang for the buck in terms of safety than the simple addition of 33% more wire would appear to offer.

Because safety grounds are as
> prone to fail as anything a third external wire tying all metal cabinet
> radios together is the only safety measure if one has a table full of
> these old AC powered beasts.
>
> Yes it is not a good policy to tie the ground and neutral together. I

The problem here is I could write for the next week describing all of the failure modes I know about that can and do happen with power distribution grounds, and grounding. But I really don't have that kind of time. It is far easier for me to tell you that doing such a thing is unsafe, and that you should NEVER connect the safety ground to the neutral at the load.

If I tell you that E = I * R are you going to make me prove it? Or can I just tell you from a position of assumed authority that this is a true relationship? You can go and find a book that will tell you E = I*R, and likewise, you can find a book, or do a google search, to find out why you should NEVER connect the safety ground to the neutral at the load.

I forgot to mention one additional tidbit: Safety ground wires are *not* as prone to failure as are the current carrying hot and neutral leads.

I have repaired numerous power cords on portable appliances, drills, saws, etc. There is one type of failure that I see over and over again, a broken power lead inside of the cord, with no sign of failure on the outside. The failure is usually at a point of stress, such as just after the strain relief for the cord. When I take the cord apart (usually to shorten it, and reconnect it inside the appliance) I have always found the break to be one that looks as if someone snipped the wire off clean and square! There is some blackening from the arcing that invariably occurs, but the break is clean and square. This is not at all like the way a twisted rope fails.

I believe the reason for this, is a single strand breaks due to flexing, a mfr. flaw, or stress. When this strand breaks, it increases the current density of the wire at that point. The wire now gets hotter at the break, and this makes it more prone to stress failures, and another strand breaks... then another, and pretty soon the wire is seriously overloaded, and the rest of the strands pop.

If I find a break in the safety ground wire, it is always a physical failure caused by the wire getting wound up in the drill bit, or cut off by the saw, or sheared off by a tool box in the bed of the truck.

Chuck I think you did a very good job and hope a few others good a
better understand of the problem. I just thought a little more info for
the group would no hurt. Being an Engineer I fully understand the
problem and Ohms law put most on this group I am sure are not and if a
new person who is us to solidstate circuit starts playing with
boatanchors it is totally different then being raised with them.

Again thanks and have a good day.

Source record: 14884

Okay, I fail to understand.

Formerly, the 2-wire cord was connected to pins 2 and 4 of the Yaesu connector. These I assume correspond to the +hot and -hot of the 120V input winding to the step up transformer, leaving the ground floating. I looked at my 3-wire cord and determined that my hot wires were the black and white ones for the 3-wire cord, and that neutral (chassis ground) was green. So I connected wall ground through ground line of the cord to chassis ground pin of the plug, leaving the hot connections unchanged.

Is there something I should be doing different?

Thanks,

The Eternal Squire

Note the multi-group posting.

For 18 years, I've been reading newgroups on Unix (or Linux) machines,
first using "rn" (readnews) and later "nn" (netnews), but now my ISP
(Kansas State University) has notified me that, because their news server
is getting old and because I'm one of only a very few users, they are
dropping the service as of 28 December.

So I need to find an alternative way of getting my daily "fix";
I sure hope someone has suggestion(s)!

You can buy a super duper feed from Supernews. For less money, you can
get a good feed (text only IIRC) from news.individual.net.

Guess we're not in Kansas any more.

Hi Squire,

The black wire is called Line, or we can call it hot+
The white wire is called neutral, or we can call it hot-
The green wire is the safety ground, and it goes to pretty
much any screw on a permanent part of the metal chassis.
(eg. don't use a cover screw, if you can avoid it.)

Technically, the green wire is supposed to have a crimped on
lug that is a closed circle, rather than a fork. This is
so that if the screw loosens, it won't fall off right away.

If the FT101 doesn't have markings for line and neutral, it is
usually a good idea to make sure that the line (black) goes to
the fuse. If Yuasu did things correctly, the other side of the
fuse should go to a switch, or relay contact.

[Note, if the fuse is one of the type with a screw in, or
bayonetted cap, the side of the fuse that goes closest to the
power line should be the hidden center pin. This prevents
you from getting zapped when you change the fuse. I have seen
a lot of manufacturers get this wrong.]

If you like using the old rn, nn, and tin servers, get a shell account
from Panix. You can telnet or ssh in from anywhere in the world, type
"rn" at the shell prompt and go. And it's ten bucks a month and the
tech support is better than you've ever had from Computer Services at KSU.

NEVER NEVER NEVER connect safety ground and neutral together on an
exposed metal chassis, PERIOD! NEVER.

What if some duffus uses a hardware store cheater on the radio, because he
house ONLY has the older two slot wall sockets? 50/50 shot that the chassis
and cabinet are hot with 120 VAC!!!

The white neutral and black hot should go to the load, the green safety
ground
goes to the metal cabinet. Also, tieing the neutral and hot together
defeats
GFIs.

Pete

That's why you're dangerous. Sorry. Lot's of people use hardware store
cheaters on safety cords so they can be plugged into older outlets.
You REALLY want an AC hot chassis, or to kill some unsuspecting
future user? Neutral and safety ground ARE NOT the same thing.

One final comment, never assume that someone hasn't replaced older outlets
with modern safety ground devices where no safety ground was available in
the
older two conductor cables! A second fatal assumption would be that the
same outlet wasn't wired with the hot and neutral reversed. That's another
reason
why the neutral and ground aren't tied together at the load.

Hi Chuck,

I'm sorry I caused such a panic with my 'alien' terminology. In my physics class 'neutral' was the name of the wire in a circuit whose potential was midway between the peaks of an AC signal.

In any case I had wired it as you said now that I understand standard terms and you understand alien terms :)

Thanks,

The Eternal Squire

Ok, Ron here is another possible failure mode: The neutral from the
pole pig goes high resistance or completely open. if both halves of the
240 VAC service are not balanced and the imbalance will cause a current
to flow from the neutral wire, to the radio and back to the ground rod.
If that current is very high the cord will smoke or burn. I had to
replace a breaker box a few years ago after the neutral corroded to the
point it exploded. I was outside at three in the morning repairing the
damn thing to cool my bedroom down so i could go to work the next day,
but nothing had the suggested wiring, or I could have lost my home.
Also, you could have trouble collecting from your insurance company
after a fire caused by your own work.

Chuck, I worked as a production test tech at Microdyne on everything except the Scientific Atlanta telemetry product we subcontracted. A new employee in assembly mis-wired the round metal power connector and QA missed it: The white and green wires went to the main power switch, and the black was connected to the chassis. Another tech ignored the written test procedure and plugged it in for initial testing to see that it didn't come on. He leaned over to unplug it with one hand on the aluminum case and his other hand brushed against the bare metal outlet box where the radio was plugged in. He got a nasty shock and if it hadn't caused his muscles to contract violently, he would probably be dead. After that he never questioned the step that required the power cord to be checked with an ohm meter BEFORE the radio was plugged in.

Hi Gang:

Well time to clear out more clutter.....here are three
copies of the British equivilent to ELECTRIC RADIO -
Radio Bygones. Three issues, Issue 92, Christmas (DEC/JAN)
2004, Issue 93 Feb/March 2005 and Issue 94 April/May 2005,
This is a very interesting and well-illustrated magazine. There is a
fascinating two-part article called German 'Amateurs" in WW-II.

I am asking $8.00 plus postage for them. They normally cost about
$6.00 per issue or $38.00 for an annual subscriotion consisting of
six printed issues. . If interested please reply by e-mail.

73,

I'm not saying that it will. The radical element is pretty well entrenched all over the muslim world...including right here at home. I don't think there will ever be 100% freedom from the threat but at least they won't be getting WMDs from Saddam who had 'em and used them at one point. Its a start. Besides, he was a mad dog asshole too.

> after a fire caused by your own work.

Hi Michael,

Yep, that is yet another good example of why you shouldn't break the rules.

I could write all week, and still not cover all of the stupid dangerous things
that have happened with ground failures and grounding errors. The NEC
is the result of 100 years of experience with power distribution, and use.
Their collective authors have seen some of the most bizarre failures, and the
code has been designed to help prevent these types of failures.

It is rather unsettling to have a line cord catch fire in the bedroom
when your wife puts a piece of toast in the toaster oven in the kitchen.

And we haven't even broached the subject of what happens when your antenna
gets hit by lightning, and you have invited the ground currents into your
neutral circuits!

In case anyone thinks that losing the connection to the center tap (neutral)
at the pole pig is an unlikely problem. Bear in mind that virtually all

of these connections are to aluminum wire. The power companies make their own rules. They don't have to follow NEC, they have their own code. When they started using aluminum wire exclusively in the '60s, they didn't think about the corrosion and cold flowing characteristics of aluminum. The power companies use aluminum exclusively for all of the wiring on their side because aluminum has the highest conductivity per pound, and per dollar, of any known material.

After they gained experience with aluminum, and knew all about its problems, I bet you think they went out, and upgraded all of the older connections, right? Nope! They left them alone. Power companies are profit driven, they didn't want to have to explain to their share holders why they would have to shoulder a billion dollar loss to fix a problem of the power company's making. So, they only fix the problem when *you* discover it.

It sure would, wouldn't it?
It's a shame we haven't tried it and are wasting precious resources while being totally ineffective against the people responsible for the actual attack. And in the process we are pissing off people who could have been our friends, and making them into more enemies.

And, using Google, you run the risk of being killfiled by a Great Many
usenet denizens because of the gawd-awful defaults Google uses for
follow-ups in its posting configuration. But, then, you knew that...

So, you being a *nix user, I can't see you getting excited about doing
usenet 'text work' with a bloated cartoon interface. I'm a *nix user,
too, and I can recommend Individual.net (http://news.individual.net/).
It's is the follow-on/re-incarnation of the free news.cis.dfn.de. It
costs 10 Euro per year and it's well worth it. I used the online sign-up
and paid via the FirstgGate (http://firstgate.com/EU/en/info.html)
service they use.

Now, if only slrn could score on top-posters. sigh...

The following are all original manuals, not copies. Prices include
postage to a US address. Thanks for looking.

-Al Schapira, KC2HRH, a.d.schapira@worldnet.att.net
==========

TMC GPR-92 bulletin:
Technical Material Corporation Technical Bulletin No. 3006, "General
Purpose Receiver TMC Model GPR-92", 1963,
includes picture, specs and response curves.
Three 8 1/2 x 11 foldout sheets, punched 3 hole. Good. $5.
See http://home.att.net/~a.schapira/pix/Manuals/TMC-GPR-92.jpg

Halli SR-160 manual:
Hallicrafters "Operating and Service Instructions, Communications
Transceiver Model SR-160", 8 1/2 x 11, 30 pgs + schematic. Minor stains
on front cover, cover separated at staples, otherwise good. $8.
See
http://home.att.net/~a.schapira/pix/Manuals/Hali-SR-160_1.jpg
http://home.att.net/~a.schapira/pix/Manuals/Hali-SR-160_2.jpg

National Radio Company, brochure, includes pictures, descriptions and
specifications for HRO-60, NC-400, NC-303, NC-270, NC-190, NC-155,
NC-105, NC-60 Special, VFO-62. Inserts for NC-121, NC-140, NCX-3,
and price list (September, 3, 1963). 8 1/2 x 11, very Good. $5.
See
http://home.att.net/~a.schapira/pix/Manuals/National_1.jpg
http://home.att.net/~a.schapira/pix/Manuals/National_2.jpg
http://home.att.net/~a.schapira/pix/Manuals/National_3.jpg

Hickok 610A Signal Generator manual:
"Operating Instructions for Universal Television Alignment Signal
Generator Model 610A", 1948, 8 1/2 x 11, 26 pgs. Spline slightly worn,
otherwise good. $6.
See
http://home.att.net/~a.schapira/pix/Manuals/Hickok-610A_1.jpg
http://home.att.net/~a.schapira/pix/Manuals/Hickok-610A_2.jpg

Simpson 260 VOM manuals:
Simpson VOM model 260 Series III, 5 x 7, 36 pgs
Simpson VOM model 260 Series 5 and 5M, 5 x 7, 40 pgs
Both for $5,

After the hurricanes last year her in Florida they finally went through
the whole subdivision and replaced every splice in the secondaries, as
well as the 7200 volt primaries. I found a number of them on the ground
and it was amazing that I even had electricity. Between the corrosion
and the thermal expansion you could pull strands out of the crimps.
After they finished my line voltage went up 10 volts, and is a lot more

stable.

I used news.cis.dfn.de a while but changed to arcor-news later because of
the now charging at news.cis.dfn.de
Arcor is still free and fast, no reliable problems. You must have a Arcor
login but this is even a free mail-account. If you like I can you send
instructions where. I don't know it just if the head.
Maybe they filter not-german clients out via your IP-address. But why not
give it a try?

Larry -

I owned this radio in the mid-1970s. This was the follow on Icom model to the crystal based IC-22A. The biggest problem with Icom IC-22S is the large number of modification articles. The diode matrix worked okay for occasional change (but not frequent reworks). It is not uncommon to see broken wires in that area.

Hi, looking for some of the small standard size (like 6-volt panel-mount bayonet bulb holder) pilot light jewel type lens covers. Looking for all-plastic types in clear, white, orange, and yellow. Some versions are opaque, some totally clear and some have a "fluting" look on the inside. Any will work. I appreciate anybody letting me buy some of these out there that might be extra and getting dusty. thanks/73, dave austerman, n5wnm, oklahoma city,ok

Might suggest you try listing them on e-bay for sale. You can try the
whole lot but most likely will have to end up breaking them up and
selling them individually. Just a thought and opinion.

Source record: 14746

The anonymous homebrew xmtr I picked up at the AWA meet last spring has finally make its first QSO, heard 589 in Texas by KE5HQ on 40 CW, but he reports what I sort of knew anyway...the rig has a chirp. The oscillator is an electron coupled 12BY7, crystal controlled. What are the cures for chirp ?? Slightly detune the buffer ?? add caps to the power supply. Trying the easiest things first, how should I proceed ??

The easiest first check is to try another crystal.

Is it a chirp (as in frequency change) or a click (as in transients caused by keying)?

Does the power supply sag at all under load? Regulating the screen on the 12BYZ may help considerbly.

My DX100 had a bad chirp. Cured by cleaning the key contacts with fine
emery paper.

Hate to tell you this, but with many classic few-tube transmitters you get your choice: either chirp or clicking or chirp and click.

If you key the oscillator, you get chirp.

If you keep the oscillator running all the time and key the driver/final, then you get clicks. Not to mention some backwave (leakage of carrier when you are key-up, leakage is almost inevitable in a tube oscillator where you running the oscillator at 10 or 20V P-P.) Without enough buffering you also get chirps as the keying of the later stages loads down the oscillator stage.

A 50's or 60's ARRL Handbook will have a chapter about the tradeoffs in keying methods. Many 4 or 5-tube transmitters, despite all their buffering and keying stages and VR tube, still have noticable chirp/click and while you should certainly strive to understand the issue, you will have some chirp with any simplistic TX. In terms of not interfering with QSO's up and down the band, some chirp is preferable to some click.

Tim.

The power amplifier, when keyed, causes the main HT supply volts to change at a rate which depends on the size of the HT smoothing capacitors. This change in HT volts also affects the DC supply to the oscillator tube which causes the frequency to change in sympathy with volts. Most tube oscillators change frequency with supply volts.

So stabilise the DC supply voltages to the xtl oscillator - especially the screen-grid DC volts. It won't matter if the DC supply volts are increased by 15 or 20 percent in the process.

Use a gas-filled voltage stabiliser tube if you can find and fit one. They used to be available in voltages from 50, 75, 90 to 150 volts.

But a few transistors could do the job.

Adding caps to the power supply will merely slow down the chirp and perhaps make it more noticeable.

If the DC supply to the oscillator is already stabilised then there may be a small amount of RF feedback from buffer or power amplifier to the oscillator. In which case you have a much more complicated problem to solve.

I just pulled out my '65 ARRL handbook and there are two SSB exciters,
each of which uses TWO 7360's.

And there are two not-awfully-fancy receivers, each of which uses a
7360 in the mixer.

Man, somebody in the ARRL must've owned stock in that tube company :-).

One more thing. If the crystal is driven heavily, it heats up and chirps. Reducing the amount of feedback in the oscillator can help, but can be tricky as well. No suggestions where to proceed without knowing the circuit.

If it ever comes to that again, don't use emery, or any abrasive paper, to clean up electrical contacts.

The abrasive tends to embed into the soft contact material, and make for contact problems.

The recommended repair is to burnish the contacts. That can be done by taking an old hacksaw blade, and grinding the flat sides on a coarse grinding wheel. The grinding wheel will put fine scratches in the saw blade's sides, and these scratches make a pretty nice, very fine file... perfect for burnishing key and relay contacts.

One of the cheapest and most reliable places where you can buy tubes is ESRC in Florida
http://home.att.net/~esrc/esrcmain.html

The 6HU8=ELL80 is an hard to find tube even in Europe. They sell it at 35$.

The 6AK8=EABC80 is common, and costs 5$. But you can spare two bucks buying the 6T8 which is fully equivalent to the 6AK8.

Jim -

IF you want a beautiful paper copy of a Kenwood manual, I recommend WB3CEZ
(who sells on eBay also - by that seller name/callsign)

I selected the owners and service manual (without the binding - I have my
own wire spiral binding system) -- it is almost as good as the original
printing !

In the old days, chirp was a favorite discussion topic.

You have been given a number of ideas, so here are a few more. When the feedback capacitor dielectric heats up, the frequency can change. Using an air dielectric is best, but a silver mica or NP0 capacitors usually work. If you do not want to regulate the screen voltage on the oscillator, you can adjust it until you find the "sweet" spot, which will reduce drift. You need a tapped resistor or rheostat to do that.

Crystal oscillators are supposed to be simple, so the cure should be simple, too. Something is heating up causing a frequency change when you key it.

Make sure you are not overloading your receiver, causing a phantom chirp (only one can hear it is you).

Chirps, clicks and fists were the identification marks of the operator.
I, for one, always admired the variance of sounds from one rig to another.
For example, at one time in history, the DX-100 was unmistakable, and if the
operator was using a straight key, one could call him by name immediately.
If your report was a "c" (534C) for example, you knew that you had more
than a "c" (chirp), but probably a "yoop", and were probably using a
rehashed command set or a liaison rig..... BC-459, BC-191 or BC-375 maybe.
BC-375 using a 28 volt dynamotor on 24 volts of fading automobile batteries
required two hands at the receiving end, and heaven help him if he needed a
pencil as well to copy!
Lynn, W7LTQ..... long live the chirp!

I find the 6T8 is not totally equivalent, but very close. It causes a
little bit of extra "shsst" when tuning onto FM stations on some sets.

I have both the 6AK8 and 6HU8 tubes in stock, I service a lot of the German
sets here in the Detroit area.

I was wondering if any of you folks could help.
I found a bunch of brand new but old marine radios in a home I recently purchased. They are each still in sealed boxes all wrapped up. I opened one up to see what they where, here is the info:
Hartman Marine Electronics Corp, NY
1500 Remote control radios with mic
Seems to have been mfg'd around 1965.
Any information you can provide would be appreicated.
Please email me directly Shlomo@HillcrestFD.org

Thank you.

I've been watching eBay to try to find a triple-threat testing set: 1) multimeter w/ regular + cap, choke measurements.....2) signal generator.... 3) freq counter. I'm just always a BIT late with my bids; I guess Heathkit is pretty popular, eh? So my question is: where might I find info on DIY equipment building. QST publish articles or perhaps Nuts & Volts or?
Thanks, Happy Kwanzaa, Merry Christmas and <insert favorite greeting here>.

Message-ID: <Jeffd.1znxhu@news.radiobanter.com>
Source record: 14778

thank-you for the reply.
One other question I have is did RCA only use one type of signal meter in their ar88's \ cr91 etc? When i originally purchased my ar88LF it came with a signal strength meter that has a black round ring around the meter face that is visible through the front panel. I was told by someone that this meter is not the correct meter for this radio. yet low and behold while browsing the net I came across a picture of another ar88 (d model) that has the exact same meter as the one i have. What are the chances of 2 people in different parts of the world both having the same "incorrect" signal meter in their ar88....sure is making me wonder about this..The site i found the other ar88 with the meter in question is at www.oldradios.co.nz
would really appreciate clarification on this by someone who knows for certain

kindest regards, Jeff

Hello gang

Little chirp never hurt anybody,
some chirp ads character to a signal

not about to change 60 year old ART-13
or play around other old style tube/hb transmitters
to try to get rid of something, I like!

key clicks diffrent story
nothing like causing crud 10 kc or more up and down band

when I hear a chirp on some ops sig
usualy it means they are running hb or older tube rig

often give them a call
know if start to talk about 6AG7 6L6 mopa, 45 push pull hartley
or autodine receivers

there is a good chance the op on the other end
will know what the heck im talking about
and
not come back with
"wx here is"

still use an old bug, so not only have a chirp,
but also some Lake Eire swing

please keep those OO cards comming in for drift and chirp
working on WAS OO

thank you
Mac w8znx, real radios still glow in the dark

In the 50's, just as today, chirp was something only a Lid's transmitter would have. It was *rare* that anyone had a persistent chirp. If someone had chirp they fixed it; sometimes with a hammer. Even some crystal chirp faults could be fixed by a little work on the bevel of the crystal's edge.

Chirp is for the birds.

Swing is for those who have it, not make it.

Yes, real radios glow in the dark, but today's fake radios have better specs and DO perform better. My old line through 60 years included BC-312, a couple HROs, HQ-129X, NC-125, SX-100, GPR-90, 51J-4, some homebrew, and some I don't recall, but I like my R71A better than all of them.

Nostalgia looks great on a shelf.

A 300W plate modulated signal using an old D-104 mike on 75M still sounds great.

Don

Like the signal I heard last night around 7070 Kc: light chirp, and a constant slow drift across the band. Lovely 1950s signal, and the op (N5BBB, I think) had a lovely fist to go with it. I could listen to it all night -- if I could catch up with it. ;=)

Is the voltage drop across a vacume tube rectifier significantly higher than a solid state plug in replacement? Previous owner of my HX-50 changed over to SS. I am changing out capacitors and just curious.

Yes, real radios glow in the dark, but today's fake radios have
better[/color]
specs
and DO perform better. My old line through 60 years included BC-312,
a
couple HROs, HQ-129X, NC-125, SX-100, GPR-90, 51J-4, some homebrew,
and
some
I don't recall, but I like my R71A better than all of them.

Nostalgia looks great on a shelf.

A 300W plate modulated signal using an old D-104 mike on 75M still
sounds
great.

Don

most of the better old tube receivers can still copy weak sig
on 80 or 40 cw than most of the so called modern
dc to daylight solid state radios

you can keep the R71A
I will keep using my 75S 3, 2A, 2B, NC 183D, HRO 5RA 1, R 390A

and if nostalgia realy looks best on the shelf
guess 300watts class b plate mod am rig should
also be set aside for modern JA rice box radios

lets see now
you object to lake eire swing and chirp
but like class b plate mod AM on 75 meters

sure sounds like the pot calling the kettle black to me

Yes, for the most part. But how much depends on the load.

>Previous owner of my HX-50
>changed over to SS. I am changing out capacitors and just curious.

Measure the supply voltages and compare with the schematic. If they
are all too high, add in a dropping resistor.

Derate all the capacitors anyway, though. They'll last longer before
the next replacement.

I think you figured it out: by derating he meant using a higher voltage rated part to replace the original. If a small additional cost isn't objectionable, you'll also find there's a higher temperature rated series of electrolytic caps available too.

Putting a series resistor would degrade the power supply regulation performance. This may or may not be important, depending on application.

The safest way to proceed would to put a (properly polarized) zener diode (or a series of several zener diodes, up to getting the required voltage and dissipation power) in series with the circuit, so that voltage drop gets (nearly) constant, independently of load variations.

What about the internal IR losses of the original vacuum tube? The
regulation should be
nearly the same if done right.

However, it should be noted that supply voltage regulation will actually decrease if you use diodes, rather than be improved.

Here is an example. Let us assume we have 100 volt primary and 100 volt secondary, and that the normal rectifier has a 10 volt voltage drop. We replace the tube with 2 series diodes, which have a 1 volt total drop and then add 9 volts of zeners. That gives us a 10 volt drop, equal to the tube. Now, assume there is a 10 volt drop in primary line voltage. Secondary voltage is 90, less 10 volts, which is 80 volts. The output voltage has dropped by 11%, while the input voltage has dropped 10%. If we still had the original tube (or a diode and resistor), then the 10 volt primary drop will result in 90 volts on the secondary - but the voltage drop will be fairly linear across the tube (and resistor), so will only be probably 9 volts. Resulting voltage out of the power supply is 81 volts rather than the 80 volts using the zener diode. In that case, primary voltage drops 10% and seconddary voltage drops 10%.

In this special case, we have created a deregulator.

Deja was a useful tool, but after Google took it over and started monkeying
(apologies to all primates everywhere) with it, it's just a source of
aggravation to anyone who tries to use it for serious work.

It's got to the point where people are ignoring posts made via Google,
simply because of the broken quoting style and infestation of idiots
using it.

Stick to real usenet, it's a lot less trouble. 8-)>
Chris.

Greetings,
Have recently aquired a Sunair GSE-924 which is a HF transmitter (100 watt).
I can find very little info on these. Does anyone have, or know of a source
for a manual for one of these radios?

Thanks,
Keith, VE3TS

You're not missing anything. Although I recommend buying only caps
rated for 105'C because they seem also to last longer than the 85'C
spec ones. But that's exactly what I mean.

Yes, but it will degrade it to the same level which using the original
rectifier tube would.

The way it was explained to me is that the 105's use a different electrolyte and tend to have lower ESR, etc. I used to bench repair a certain power supply that would make short work of ruining an 85...only a 105 would hold up. And it wasn't a heat issue.
They seem to be worth the few extra pennies in cost.

I use "original recipe"-style USENET access for everyday entry to newsgroups. But Google's archives are useful for searching. Many times, I have found answers by searching the archives rather than posting a new question. Quicker, and it avoids repetitive postings.

A recent example is the "SS Rectifier conversion volts drop" topic in this group. If you search this newsgroup, or one like rec.antiques.radio+phono, for subjects like "rectifier voltage drop", etc., you'll find plenty to read.

Sunair is still very much in business, and they will sell copies
of manuals for their older radios. However, said books are not cheap.
Expect to pay at least USD $125.

http://www.sunairhf.com/

Happy hunting.

5498. FS: Transmitting Tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-13 03:30:39 UTC
From: Jim McShane <jimmcshane@prodigy.net>
Message-ID: <zfrnf.3747$fO5.174@newssvr33.news.prodigy.com>
Source record: 14837
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I have accumulated some transmitting types that
are really unfamiliar to me, as I specialize in audio
and guitar tubes. Rather than just let them sit, I'd
like to find them a good home. Most are JAN or
FAA designated, all are USA made.

I've priced them at about 1/2 of what the typical price
was that I could find on the web. I can't test most of
them, but all are guaranteed not to be D.O.A., or I'll
refund the price.

Here's the list - it's the quantity, then the tube number,
followed by the "web" price (mostly from RES or RF
Parts), then the selling price:

Qty. Type Web Price My
Price ea.

1 2K25 $25.00
$13.00

1 3E29 (829A) $14.00 $7.00

1 5D21 $42.00
$21.00

1 705A $10.00
$5.00

3 815 $15.00
$8.00

1 826 $35.00
$18.00

2 829B $14.00
$7.00

2 832A $7.00
$4.00

1 8122 (used?) $225.00 $75.00

1 7034/4X150A $90.00 $40.00
(new in box Eimac)

(3) 4-125A/4D21 $95.00 ea. $50.00 ea.
(2 Eimac, 1 GE)

Drop me a note if you can use any of these tubes, they need
a good home. Thanks so much!

Phil, I was doing that when it was still called DEJA. ;-) I still use
Netscape 4.78 to access Usenet. Its a clean and useful format that
allows me to read a lot more messages in a given time. I have tried a
number of other "mail and news" software, but I keep going back to the
old netscape software. Also, I have a large private archive of Usenet
posts that may come in handy later on. I can open them with a word
processor and do a keyword search without having to be on line at the
time. For instance, I have archived 1356 files from this newsgroup.

Create list like this in a fixed width font like "Courier new" so they
will stay in neat columns. Change to a fixed font and look at this:

Qty Type Web Price My Price
(each) (each)

1 2K25 $25.00 $13.00

1 3E29 (829A) $14.00 $7.00

1 5D21 $42.00 $21.00

Fixed font only is relevant if your newsreader is using the same font,
otherwise the display is still same - good idea though.

It won't look right with different variable width fonts either. Try
to figure out a ASCII schematic drawn in a variable width font sometime
and you'll switch your setting to fixed font.

All fixed fonts use the same character spacing, its the variable
fonts that are variable. ;-)

Better yet, separate the items in line with d-a-s-h-e-s, or
u_n_d_e_r_l_i_n_e_s, any character will work actually.

The message may look funny, but is readable in any browsers font
setting... 8-)

While cruising the web, I found a site that needed this data sheet.
Since I had to scan it anyway, here is a posting of Brimar's D7-200GH
small CRT data sheet.

Apparently it is reasonably hard to find.

http://novatech-instr.com/Fun/d7-200gh.pdf

It's about 1MB.

Steve.

Soliciting advice here. I am not so familiar with these old boatanchor transmitters.

Just about done with a re-cap and a re-transformer and into this thing for way more than it's worth. Any advice concerning powering it up. I don't want to let any smoke out. I figure I'll make sure fuse is proper size and wind up slow on a variac. Maybe pull out solid state rectifier tube replacement and run thru the thing - oscillators, sideband, and audio and so on.

Any advice give is surely needed and will be appreciated.

With the holiday season here it is time to redo the workshop and the
workbench in particular.

So, what suggestions do you have for setting up a good efficient
workspace for electronics?

Here's an example that I found....

http://www.stevenjohnson.com/workbench.htm

So what does your workspace, test bench and layout look like?

Pictures and links would be great.

What has worked for you?...what hasn't?

Benches, racks, cabinets, tables, carts....

Any particular test equipment that you would recommend for or against?

Thanks

TMT

Well, it's certainly cleaner and neater than MY bench!

If you're interested in building (with surface mount components), see:
http://www.w1ghz.org/222xvtr/222.htm

Small board. Designed to use Yaesu FT817 as an I.F. rig, but any rig that can provide 24 MHz at 1/2 Watt is useable. Transverter puts out 5 Watts, so an external amp could be used to boost output if desired. I have the circuit board for it, but it's not built yet, so I can't comment much. A friend has one and hasn't said anything bad about it that I'm aware of...

My workbench looks like an absolute fright unless I've been very
unproductive (and therefore have had time to clean), or I've reached a
standstill (and therefore must clean).

Otherwise I just look at the pile and ask myself how long ago I used a
particular tool, then I look that far down to find it.

I like the pictures of the shop..really neat and clean..I have worked in radio for about 60 years and you get sort of "set in your ways".. I like to work on a roll around cart about 24 X 30 in. 28 in. heigh.That way you can have test equip and tools within reach..I have all the digital test sets and I always have an analog meter,like Simpson 260 and Tripplet.630 ...Also I have a complete soldering station with everything modern,,but I always have a gun or two on the bench also..For boatanchors you really need some analog stuff,like HV multimeter to 6000 volts etc..A maglight is a must for close in work..A good assortment of power supplies,from 0 to 50 volts regulated and a good 12 volt PS at about 30 amps.or more..A good scope to at least 50 Mhz,preferabily 100/200 mhz.If you get a Tektronics scope you can attach a didital counter to the scope (ch.1 out)and read frequency as well as pattern.Helps when working on freq .multipliers etc..Just some ideas and suggestions..Good military Test equip. is available for pennies . repairing it ,not always easy..Good luck W4PQW

If I ever manage to get to the point where I can find the bench
underneath the clutter I will be more than happy to send you a photo
of it. I should have taken one when it was new for sentimental
reasons! :-)

Irv VE6BP

P.S. If you think the bench is bad, you should see the shack!

news:alt.binary.pictures.radio has a contest from time to time with
pictures of workbenches and home shops. Its about time for someone to
post another "My bench" photo and start another round over there.

Oh deep joy !!! That is a perfect description of my workshop. I wish I
could keep it looking like the pictures in the post above. I have as much
benchspace, but on an average day, probably about 18" to 2 foot available

...

On another similar sized bench behind me, I have one of the workshop computers, the weather sat receiving equipment, and my amateur radio station. On that bench, on a good day, there's just about room for the station logbook !

Arfa

Those look like part of the bench - I know some of the brands of benches
available used to have the plugs there. My benches have a 6' strip with
plugs every 3 - 4" that we bought from I believe Tripp Lite last summer.
They were quite reasonable with a lighted, covered switch, circuit breaker,
a 10 to 15' long heavy grounded cord, with a nice extruded aluminum housing
for ~$70 CND @ something like 7 qty. They make many styles and lengths.

Size of stuff to fix upon determines the design of bench and tools.

I'm TV tech;
Big ones like 36'ers demands at least 5 feet by 10 even more feet
bench to allow for tools to lay besides the unit. I have wished I had
that because of few CTC210/DTV306/etc that needed the depth so I can
push the unit way forward so I can eagle spread the crowded chassis
that weighs a tonne and clumsy to handle just to freaking replace 10
parts in worst places. Lot of chassis flipping just to see as you put
new parts in and remove and resolder transformer for that R14609 tiny
10 ohm resistor that's now a black crater, that D14611 did to
components in standby SMPS.

Be make sure the bench is high enough so you don't bend over so low
but not too high to heft heavy TV up there. Flat CRTs are heavy!

Cheers, Wizard

The TekScopes group on Yahoo did this awhile back, too. Lots of fun to
look at other scope junkies' benches.

I dont do much tronic work now, but just did some today. A lot of the
things I found are just as true in what I do now though.

The no. 1 handy thing is a little hand held probe that amplifies and
send the signal to a piezo. Its an imprecise but very quick way of
finding out roughly whats going on here there and almost everywhere.

The one thing I avoided like the plague, and still do, is those plastic
drawer racks with often open top drawer boxes. You've only got to move
one once to see what I mean! One spill and you'll never ever buy one
again. Small parts containers must have burst proof latches, I wont use
any that dont.

Domestic chipboard chests of drawers are a good quick cheap way to get
storage space in situations where you can be sure nothing will be put
in front of them. Especially good where your storage expands into
living space. They sometimes need reinforcing, ie more runner screws
and gluing draw bottoms in. Yes its ok to do that with chipboard
drawers (not with real wood ones tho).

Wooden shelving has the advantage that its easily made in any size,
weight and shape to suit your workshop. And with any features you want
on it. If you want large quantity or heavyweight, its also less money

than large amounts of steel. A lot slower to put up, but much more adaptable. Shelving racks of all kinds can have overhead linking bars betwen them to make them rock steady. Realise a shelving rack collapse can kill, they must be rock steady.

If you can take a photo of your workshop, youre failing to use a lot of the space.

Cardboard boxes have always been my favoured storage cases, as they offer some amount of protection in case one is dropped, and theyre freely available at any time, which is also important. And any size. As I've found, always label them!

For the ultimate in space efficient storage theres always tracked shelving racks, but theyre not cheap. Metal racks on tracked wheels, with a big knob/lever that you turn to move them. One only need maintain one gangway between the lot, move them to enable to get to where you want. Very effective if youre storing on a larger scale, and space is expensive, as it is here (very). A serious space saver, but access is slower. Fill them in order of whats most used to minimise moving.

Soldering guns I've found almost useless. Theyre not good performers, and how many jobs are done so fast there isnt time to do something else while an iron heats up? Havent used mine in so long I dont even know where it is.

Gas lighting has proven more reliable for power cuts than battery, though these days battery exit lights are now common.

NT

I moved over 1000 miles in 1987 and I had 24 50 drawer Akro-Mills
cabinets full of parts. I cut pieces of cardboard to cover the front and
placed two of them face to face, then taped them together. I didn't
have even one part out of place when I arrived at my new place and set
up my shop. The move was done with my shop's step van and I hauled over
17,000 pounds of tools, parts, manuals and test equipment in two trips.
there is nothing wrong with parts cabinets, if you know how to pack
them.

The last time my bench was clean was over a decade ago - after I learned I had a very aggressive form of cancer. I reluctantly cleaned off the bench to save my wife from having to do it.

But, through the miracles of drugs, the cancer went away. Now, my desks are all cluttered again. My wife fondly talks about how good life was when my desk was clean and I had sold much of my junk. I think she is kidding, but would not bet my life on it.

When I clean an area, it is only temporary.

At the constant prodding of my wife, I spend 3 months cleaning up the floor of my darkroom. I found things that had been missing for years. But, I could not clean up the desk, for it has all the little parts for which I do not have a place for.

In the end, messiness is really just the product of someone who has so much order that he insists upon a place for each item before he puts it away.

Gee Whizz this 36 inch I have weighs in at 200 pounds.
Maybe you need to think about a motor hoist with straps or something.
I know by myself this TV will never be moved. Maybe it can sell
with the house some day. Good luck with the hernias.

I have a 12 X 24 patio I am thinking of enclosing and making a shop...
so I am following this thread too. lol where ever it goes

Bob,
I think you have the right idea. Bring it up with the Variac without the rectifier and see if everything lights up, and then start over with the rectifier in place.

I would keep a voltmeter on the B+ line as you bring it up.

I had an HX-50 in my shop almost 30 years ago, and remember the rig but don't remember details.

Recall that it was a filter type SSB job with a 6DQ5 final and put out maybe 30-50 watts or so.

Do you have any history of the rig and did it work before the transformer conked out?

John

That's an amazing shop. My own is unfortunately nothing like it, far more cluttered with junk piled all over the place, I suspect it's typical of other hobby techs here.

I suspect it all comes down to how you use them. Where I had mine,
there was no room to mount those cabs on the wall, so accidents were
inevitable... and could take forever to clear up. If yours are screwed
to the wall, no worry.

Space costs vary widely around the world, and here things are pretty
cramped. So much so I wouldnt really want to post a pic. Reading of
folk with 14' benches makes my brain boggle! Fanciest I ever had was
6', the worst was... well theres space on top of those boxes.

I imagine in Hong Kong it would be a case of, well, this one should fit
on the laps of your 4 roommates, who could sit their keyboard on top of
the screen so they can continue typing. Maybe one can rent desk space
there, wouldnt be surprised.

YOU CALL THIS A WORKBENCH!?!?!?
my Goodness, if the mess on mine is les than 5 inches deep I feel I
didn't do anything on that table! You know, I trained myself to
identify location of things by the sound they make when they fall on
something else when I throw it aside. If I were now to mop it up , I
wouldn't be able to find anything!
In any case I wish you good luck and I congratulate you for the
initiative.

In W4OP_2, what's the rightmost gadget? The one in the gray case,
with the meter(?), some gray knobs, and 2 toggle switches on the
front, and a black box on top of it? There's a printer behind it.

Looks like you've got good taste in CAD tablets, too.

While I haven't built my bench yet, I've been planning it a Looooong time. I've assembled this list from having lived in my dads shop for 15 years and worked at various research labs for 20....

1. Desktop - I prefer a deep top, on the order of 40" or more. Reason being that when test equipment becomes attached to larger devices (i.e., TVs), space becomes a premium, and laying a schematic on a hot chassis is not a good idea ;).
2. I like the top shelf idea but would use it for test gear that doesn't need to be watched or interacted with a lot while in use. Scope and logic analyzer on the bottom, Frequency generators, PS, etc on the top. A verticle shelf of test gear along the side works good for me.

3. Lots of outlets/wire mold. Wiremold along the back with 1" x1" panduit wireway to keep the power cords routed.

4. Power cut off switches for parts of the bench.
5. power conditioning for all of the bench (CV transformer/harmonic neutralizer), Also GFI protected.
6. Work lights - magnifier, fluorescent and incandescent. Why incandescent? Floursecent are such great RF radiators and influence some of the gear I design/work on.
7. VTVM and DMM (I am old fashioned - Depending on what I am measuring, I like a meter that can withstand "hitting the wrong testpoint"
8. Test lead, jumper clips hanger - Use 1"x1" panduit with one side cut off for hanging test leads.
9. storage shelves. For components, I like 6-9" deep, for test gear, etc., I like 24" deep.
10. IC storage. I tend to keep lots of ICs around. I like to keep them in the plastic carrier strips, cut a hole in one end and hang them.
11. PC and inventory control. I know this sounds a bit overboard but...print out barcode and attach to every spare part before stored. Scan when used. Keeps an inventory in a DB of parts. You have no idea how many times it was my job in my dads store to look for a part that he 'knew' he had. Also, since I collect old computer 'stuff', It is nice to have an inventory list.
12. A separate section or separate bench for 'fabrication' that would contain drills, hammers, vise, etc.
13. One idea that I saw for a woodwork bench that I like is a number of verticle, slide out, pegboard pieces (about 2-3' high and 2' deep that sit under the bench. The are verticle, perhaps tilted back slightly, and can slide out. Organize tools, whatever. Keeps them from being piled in drawers and saves time hunting them.

14. Get service data in electronic format. Get a scanner and PC. I grew up with and still have tons of service manuals and data books. Using PDF versions of all this stuff saves time and space. If I could only get my 15 yo data books on DVDs I'd be soooo happy...
15. Antistaic mat on benchtop and also floor pad (or paint, depending on situation)
16. I have often found the need for a hefty heat gun (in lieu of a reflow furnace, and also to remove components in mass...lol)

17. A 'L' shaped bench works better for me than a long one. Also, ppl sometimes put pegboard on the back of benches to hang stuff..I don't like that because I don't like reaching across my work. Personal preference.

18. If you do serious work, I recommend mainstream test gear (HP, Tek, Fluke, etc.). You can trust what you measure. I know cost is an issue, which is why I'd get good used gear. For example, I'd get a good used Tek 465B, 475 or 485 over the newer DSOs. Most of the time, I don't need color, I don't need it connected to my network, etc. (But I do have one just in case...)

I've build this bench many times in my head and even started it in my basement, but never time to finish.
Good luck
John

You're supposed to ty-wrap it to the cord, out at the plug end, so that
you can't use it while the drill is plugged in. (Keeps your hands in
one piece.) :-)

Cheers!
Rich

Hi John,

Unfortunatly I have no history. I bought it off Ebay from
deadpeoplesthings.

When I got it there was three transformers inside in an effort to
duplicate the one factory. I stripped them out and bought a very
expensive (ouch!) Peter Dahl replacement. SK made some relay
modifications and the solid state relay and holes in the chassis all
over the place. Looks like swiss cheese.

I'm into it for about 500 bucks and almost running. Last capacitor
should be on the front porch when I get home. I'll probably trash the
previous owner's relay mods before I power it up. One of the relays is
a T/R switch which I can do without.

I sold a nice HT-32 last summer in order to pay for a Drake R8B that I
just had to have. HT32 was excellant shape with new finals and
alignment. I sold for $200 so I gave it away. And the HT32 is twice
the rig the HX50 will ever be.

I don't fret too much over the time or money I got into this rig. We
do it cause we like to. Right?

Hi Mike,
That's a General Radio 1236 meter I use for measuring sun and moon noise on
my 1296MHz moonbounce station. It is a 30MHz IF amp with decibel meter. In
the extended mode, I can easily resolve 0.05dB changes. Sun noise
measurements are an excellent standard by which we judge system efficiency.
On 10GHz I can see about a dB of moon noise- which is also handy to keep the
dish trained on the moon.
That pix is pretty dated at this point- the 746 has been replaced by a
756PRO II and the SSB transverter has been replaced by a DEMI 1296-->28 MHz
transverter.

That doesn't work on my drill press. Its chained to the wiring cover
on the motor and only has a couple inches of slack to keep it out of the
way.

> --scott

A vacuum rectifier shows a non linear behaviour, whereby the voltage drop vs. current tends to saturate (until one exceeds the rectifier rating). So, using a resistor to simulate the vacuum rectifier voltage drop, would cause a worse regulation around the rectifier operating point.

But even disregarding the above consideration, putting a resistor instead of a zener diode would mean losing a chance to improve things.

Contrary to regulated power supplies, the regulation performance of a non-regulated power supply is defined with regard to load variations, not to mains variations. As a matter of fact a non-regulated supply is inherently unable to tolerate mains variation, whilst it can tolerate load variations if properly designed (think of input-choke power supplies). Regulation (against load variations) greatly benefits from having a series zener in place of a series resistor.

It is however true that, for a mains voltage drop, using a zener diode will cause an extra small output voltage drop.

I use a series zener diode in my car to drop the battery voltage down to about 9V, as required by my VHF handy-talkie. If I would have used a resistor instead, voltage would significantly vary from reception to transmission.

Clearly there is no need at all to use an expensive power zener diode, as a plain power transistor with a small zener connected between collector and base does precisely the same job.

You can see my workbench if you click the "original photo" link at the bottom of this page.

http://antiqueradio.org/tabloid.htm

Basically -- two 4x8 sheets of particle board atop a 2x4 stand. An old dentist cabinet for little supplies. Lots of shelves. You don't need to get fancy or spend loads of money.

In an average radio project, I'll use a multimeter and signal generator. I have maybe 20 other pieces of test equipment, but that stuff's mostly for fun.

Regards,

Phil Nelson

Hmm, then maybe you need a little bungee for it. :-)

Hey! I just had an invention! The chuck key plugs into a dead-man switch
socket! It's right there on the drill press, and you pull it out, it kills
the power, you use it, and you have to poke the chuck key back into its
socket or the drill press won't turn on! ;-)

Nah, they'd defeat it with a nail or something.

Good Luck!
Rich

Bob,

You really do have some money in that little rig. Is that Peter Dahl specifically wound for the HX-50?

You're right about the money invested. If it's something that you consider a challenge and you enjoy the feeling of accomplishment in finishing the project, I say it's worth it.

Too bad you had to let the HT-32 go. It was 1958/59 when I met a local ham who had an HT-32 paired up with an SX-101. What a nice looking station. Lot of money in those days. The next time I visited him, the SX-101 was gone and replaced with a Drake 1A receiver! The HT-32 looked heart broken sitting next to that little 1A.

Let us know when the Hammarlund draws it's first breath.

If you combine that with a self sealed relay as the run contact
(momentary N.O. pushbutton to start, momentary N.C. pushbutton or
pulled key to stop) I think it would be just great. I just wouldn't
want the motor to start at the moment I plugged the key in the hole.
I might just add that to my press.

Not new, I installed one of those on the drill press where I used to work, more than 20 years ago. Guys kept leaving the key stuck in the chuck and then turning to motor on... Not good.

Hi Bob,
Guilty as charged. A lot of work gets done on it though. Last year an 8 band
HF RX with all the bells and whistles:
http://www.parelectronics.com/pics/w7zoi13jpg.jpg
http://www.parelectronics.com/pics/w7zoi14.jpg
http://www.parelectronics.com/pics/w7zoi15.jpg
http://www.parelectronics.com/pics/W7ZOI11%20copy.jpg

A total rebuild of an SX-88- right down to new front panel silk screening/ 2
tube water cooled amp for 1296/
Homebrew Regen:
http://parelectronics.com/pics/regen2.jpg
Homebrew (KE9OA design) DDS RX:
http://www.parelectronics.com/pics_old/old/Pg150.jpg

Latest is an air cooled 400W solid state 1296 MHz amp- no WEB pix yet, but
the 90Amp P.S. has me as worried as HV.

Ahh! That makes perfect sense! I had not thought about that... I guess
I always just thought about the diode conductance as being a fixed value.

Hmm.... I just got out the old RCA Receiving Tube handbook and the only
rectifier I can find with actual curves is the 5Y3... the curve is pretty
flat, but you're right that it isn't linear. No knee on it, though.

Is this typical? Are the gas-filled types significantly different (other
than the turn-on discontinuity)?

True.

Not much industry experience, huh? ;-) I only mention it because almost
every major industrial-grade tool I've seen has "ON" and "OFF" buttons,
and a latching contactor. If power goes down, or the "OFF" button is
pressed, or the "EMERGENCY STOP" button is pressed, the machine turns
off, and doesn't restart when you reset the breaker - you have to
overtly press the green "ON" (or sometimes "START") button. This gives
you a chance to clear the scrap out of the machine before you reset
and restart whatever process got stopped in the middle.

Probably cost-prohibitive for a consumer-level garage or basement drill press.

Then again, people pay for explosives inside their car in the name of "safety"; why not add fifteen or twenty bucks to the cost of a power tool if you can tout it as a "safety" feature? ;-P

Thanks!
Rich

Because people are convinced that air bags are there to protect them when
OTHERS crash into them, whereas few people are willing to pay for extra
protective measures to protect them from THEMSELVES! :-)

I prefer the small chain. If someone turns the drill press on with it
in the chuck there is a weak link that will snap and not whip the chain
all over the place.

I've got a scrap bench top drill press that was built with a switch
lick that. Its the second one my dad has killed in the last seven
years. You couldn't flip the power switch on the first one, till the
chuck key was wedged into the hole.

Well, the one I got at the supermarket for some 40 euros has one.

They're actually simple devices: a switch where the latch is a tiny
coil. Not expensive at all, if made in sufficient volume.

A little off topic, but air bags don't protect anything. People have air
bags and now think they can drive more aggressively as they are
"protected." Four-wheel drive also makes people drive in conditions they
normally would not; but four-wheel stop is the same for both.

>
> Is this typical? Are the gas-filled types significantly different (other
> than the turn-on discontinuity)?

All vacuum rectifiers show a similar behaviour, corresponding to the so-called 2/3 law. The I-V curve is typically S-Shaped. At low currents, voltage drop grows with current. For higher currents, voltage drop does not grow too much with current.. If current exceeds tube ratings, voltage drop again strongly grows with current.

I could not find the curve for a mercury rectifier. An old RCA tube handbook reports:

- for model 83 (mercury rectifier): voltage drop: 15V
- for model 5U4 (vacuum rectifier): voltage drop: 44V at 225mA, 50V at 275mA, 54V at 300mA

I recently acquired an AN/GRR-5 system. The Filament Vibrator, E102 on the schematic, finally quit. Taking it apart revealed that the metallic vibrating plate had broken across. According to the manual, it is a 4-pin unit, OAK P/N 6556. The one in the power supply is a Cornell-Dubilier Type 8360C-2. Anyone know of a souce for them, or is there a solid state replacement available. Any leads greatly appreciated.
Thanks, Wayne

Try Antique Electronics Supply. They have various vibrators available
new, as well as some of the solid state replacements. They may well
not have an exact replacement but they may well sell something adaptable.

Sorry, out of town for a few weeks.

The Astronet guys observed that the flashes were conicident
both in time and location on the moon when observed from various
locations up and down the west coast. Conclusion was that the flashes
were meteor impacts on the lunar surface. I think this was later
confirmed independently.

One of the guys had an interesting 80m setup. Separate Tx and Rx,
and 1kw amplifier. He had an separate Rx antenna, an IF output
jack on the Rx, and an electronic TR switch on the Rx.

He would connect an oscilloscope to the IF output of the Rx, and
hit a few dits on the keyer. You could see the transmit waveform
as full-screen signal, then nothing as the Rx recovered back into operation
after a few tens of microseconds. Then you could see the backscatter
pop up on the receiver scope. The keying rate had to be fast enough
and completely synchronous to see it on the non-storage scopes of the
day. But he was able to measure the time to receive the echos back
from the ionosphere and pretty much could predict whether he should
bother operating the net that night (with reasonable accuracy). The echos
were somewhat smeared out, so the return signal was undergoing a somewhat
distributed reflection process.

I don't recall if the backscatter was normally TX->Ionosphere->Rx or if
it was Tx->Ionosphere->Ground->Ionsphere->Rx
My recollection is that he had seen both cases.

I've had this thing for quite a while. It appears to be a very
nice VLF (14-500KC) receiver. Hopefully someone out
there has schematics so I can get it fired up. I could also
use any info about the external power supply (which I don't have).

Yes, I've checked BAMA and done a Google search. No luck
there.

Lots. I just described it for those who do have not seen this common
control circuit. And, sadly, most home power tools have no such

control circuit.

Source record: 14612

I'm a fairly new owner to the Drake line...

Having a small problem with a tr4-c and was hoping someone could send me in the right direction.

After TX (cw) when relay releases, the RX sounds some times muted but still there, the S-meter will rise up the scale to about 40+ and the rx freq is off a bit (like on the wrong sideband)

If I re-Key, all will return to normal...this problem will happen about 50% of the time... looks like relay is fine), but more like the mute curcuit is hanging...??? AGC?

Can someone point to the right tube/area to check for this problem? I'll have to get some tubes to swap out but don't want to get all at this time.

Tks to all in advance

best holidays,
Tom

Why do you say that it looks like the relay is fine? Have you tested its contacts? Have you looked at its contacts? Just because it goes kachunk doesn't mean it is doing its job. Every symptom you have described is classic for T/R relay contact problems.

The contacts on T/R relays in tube radios often get corroded, smoky and intermittent. The first trick is to rub a piece of paper soaked in 91% isopropyl alcohol between each and every pair of contacts. operate the relay manually so that the contacts close on the paper strip. Keep doing this with fresh paper until the paper comes out clean. If the paper tears, the contact is pitted, and will need to be burnished. Burnishing is done with a piece of hardened sheet steel that has been ground on a course grinding wheel to make scratches that are like a fine file. You use it like a fine file.

Do not ever use emery paper, or sandpaper of any kind, on the contacts of a relay. Don't use a file either.

Hi Chuck,

I guess I should have been more specific...I pulled the relay.

I had pulled the relay and looked at it (it's new as the tr4c was newly
rebuilt when I rec'd it). took a few readings and all was ok without
power of course.

Anyway, I re-pulled the relay (thank goodness for sockets) and poped off
the plastic cover...
Using an old elmer trick for keys, I used a strip of a dollar bill and
some alcohol. After doing all the contacts, put back in.

Well, you were right! I just got done testing it and it looks good for
now... time will tell... no more problem after 15mins or so.

Thanks agn

Hi Tom,

I have seen this problem many many times. The relays have contacts
that were designed to run at several amps, and we are using them for
microamps in some of these circuits. The contacts would self clean if
enough current was passing through them, but how much current do you
really need to switch a crystal oscillator from USB to LSB? A proper
signal relay would have gold plated silver contacts to help prevent this
problem. WECO relays used in the phone system were actually made so that
each actuation would make the contacts wipe against each other.

A dollar bill is made out of really terrific paper. It should be excellent
for cleaning contacts. I used to keep some cotton bond typing paper around
for the job, but laser printers have rendered such nice paper obsolete.

With any luck, you won't have to clean the contacts again for a couple
of years.

The page I ordered from had two types listed: a Chicago Miniature 323 for $1.79 and a Micro Lamp 323 for $1.19. I took a chance on the Micro Lamp. Genuine Chicago Miniatures arrived.

Agreed. Since the general concensus is that these things have vanished off the face of the earth, it seemed like a pretty good deal.

Im in need of 6DC6 (this may be tough to find)
also..6BE6,6GW8,6AL5 in order to get my
sx130 working. I got in from my uncle (SK) and
some of the tubes are missing. Otherwise looks good.
- I have a tube tester and could perhaps reciprocate
by trading some good tubes back the other way or
..I have lots of parts ect and maybe swap..or just pay
cash. tnx for reading..Im about 2 hours drive west of
Sault Ste Marie Michigan. Earl VE3AB

Thanks for the responses so far....

A few more questions....

How much and what type of storage do you have?

How are the workbenches laid out most efficiently? L shaped? U shaped?
T shaped?

How much stationary and how much mobile?

What do you like for lighting?

Has anyone built power busses into your bench? If so, what was it?

How about floor coverings? Ever drop a tiny screw or surface mount part
on the floor and spend hours looking for it?

FWIW, the sources I usually use:

http://www.radiotubesupply.com Even though Roy is in Ohio, he accepts Michigan dollars.
http://home.att.net/~esrc/esrcmain.html
http://www.thetubecenter.com/
http://www.vacuumtubesinc.com/
and of course https://secure.tubesandmore.com/ but generally their prices are higher, unless one of their sale items happens to match what you need, like the 6688's I picked up for $2.50 each.

There are many more.

Group (and Chuck)

Well , back to the tubes...
The tr4c is fine till fully warmed than the problem comes back.

Recap;
> After TX (cw) when relay releases, the RX sounds some times muted but

Relay cleaned but problem pops up when fully warmed up after 20+ mins,
I'm going to pick up a new vox curcuit tube (6fq7) and replace to
eliminate that... will post results.

Tom

Darn!

I doubt it is a tube, start looking at electrolytic capacitors, and
resistance values. The old carbon composition resistors tend to drift
up over time, and electrolytics, well, they don't do so well with time.

5587. J.L.A. McLaughlin Signal Splitter -- sideband convertor?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-17 18:14:04 UTC
From: Steve2 <mcallister3903@comcast.net>
Message-ID: <75adnSNB4vDxyDnenZ2dnUVZ_sGdnZ2d@comcast.com>
Source record: 14626

Hi,

I have a JLA McLaughlin "signal splitter" model number MCL 10 VBX. I would guess it's from the 1950's or so, and I'm trying figure out what it is and maybe get some history on it.

It was used in a set up with a R-390A, R-389, and a Panoramic Radio Panalyzor SB-8b. My guess is that it's a sideband adaptor since it had an input from the IF of the receivers and has an "upper" and "lower" switch. It's in a rackmount chassis with a black crinkle paint face plate.

Is anyone familiar with this?

Thanks,
Steve

It is indeed a sideband adaptor, and it will work with any receiver that
has a 455 MC IF output. I've been looking for one for years.

I'd guess it was from the early sixties. There were a lot of similar
devices that became available as commercial SSB took off. As I recall,
this is not one of the super-high-grade ones with the 7680 sheet-beam
tube, but the IF filtering on the 390A is good enough that it shouldn't
matter much.

Too_Many_Tools wrote:

> Thanks for the responses so far....
>
> A few more questions....
>
> How much and what type of storage do you have?

seems there are pros and cons to all of them. Budget is a relevant question, you wont get tracked racks on a limited budget.

Cardboard boxes are budget-free, most flexible, spares store flat, and you can cut them up for sound proofing.

> How are the workbenches laid out most efficiently? L shaped? U shaped?
> T shaped?

I dont know. I've always gone for multilayered where possible. But whats best depends. Being able to put some kit on a half depth shelf under the worktop saves space. And another high shelf gives more opportunity for more gear thats semi within reach.

> How much stationary and how much mobile?

if theres room to move anything about, youre not using your space efficiently.

> What do you like for lighting?

Flourescent 3500K, 2 or 3 lights with switchbank so you can vary the level. High brightness is quite unpleasant all day, and gentler lighting no good for all work.
5w CFL inspection light. Ultrabright LED on the end of a foot of bellwire for a tiny spaces light inside equipment - very handy. Be sure to sleeve insulate it.
The one thing I've never found handy is an anglepoise. Too large, too uncooperative, too often in the way.
Magnifying light for sm work - though I dont have that here.

> Has anyone built power busses into your bench? If so, what was it?

On front of, side of, above, behind, under, yes, but not into. Into is too inflexible, and a pointless money spend imho. I used built-in at work but never thought it the best option.

> How about floor coverings? Ever drop a tiny screw or surface mount part
> on the floor and spend hours looking for it?

No, consider what the part costs and what your time's worth. There are normally more in the box. I always use a multicompartment tray to put removed bits in so this doesnt happen.

I suppose antistatic lino would be the ideal floor, but never had it. Ordinary vinyl floors are the worst for static, I'd avoid those. Concrete conducts more than I'd like, puts humans at risk. HT PSUs with reservoir caps are effectively not protected by RCDs (GFCIs). Wood is the best imho, its insulating, doesnt generate static, comfortable, smooth surfaced, looks good, feels good, is often already in place, is low cost, easy clean, low noise, what more could you want?

Dont overlook climate control. I dont know where you are but summer dryness isnt good for static. A wet towel and fan restores RH and catches pollen, if you dont want to spring for proper climate control. Also fumes can be an issue at times, esp burning plastic, though I've never considered going as far as a fume cupboard. Outdoors is fine for that occasional job. But if you really wanted everything, I guess a powerful extract fan at the back of the bench would see occasional use.

Dont forget to ask the cat too. You need somewhere comfortable and close for kitty, somewhere that keeps an obstacle in the way of climbing on the bench, so you get enough time to take action re soldering iron, voltages etc. In practice you need a few somewheres, and the cat will decide which is good. At least one within reach and one out of reach.

When you get on to test gear, definitely have 2 computers. One for the serious stuff, the other one you can put every bit of unknown but looks interesting software on you want, turn it into an all singing all dancing all crashing test centre. I never knew I needed a vector scope, but with a PC its free. Ditto a wide range of variable performance test gear.

Try opening and reseating connectors between the display and the
main board. They go a little funny after many years. I had
this with a TS-120 and an 820!

Ralph -

I have never seen Pyramid or Temma release to the public their schematic diagrams (BUT Astron does -- support & quality)
http://www.repeater-builder.com/astron/astron-index.html

IF this is a linear power supply (large heavy transformer) -- a majority of these designs are based on the common "723" regulator chip [IC] (originally designed by Fairchild Semiconductor in the 1970s) with 2N3055, 2N3771 or 2N3772 transistors on external heatsinks serving as the "pass" transistors. [LM723 is the Signetics number]. Pyramid likes to solder this chip to PC board-- which I replace with socket for future service.

You will find most of the information you require on the KBT DC Supplies web site
http://www.kbt-dc-supplies.com/index.php

David Metz's classic 1996 web page on linear power supplies.

> How much and what type of storage do you have?

I take what they give me- but I prefer those big roll around
multi-drawer jobs with each drawer user partitioned.

>
> How are the workbenches laid out most efficiently? L shaped? U shaped?
> T shaped?

Makes no difference- all lined up against one wall works well, the
mobile stuff needs to go in a rack anyway- roll the rack to where it's
needed, some people prefer carts.

>
> How much stationary and how much mobile?

Every thing goes mobile at one point or any other. Stationary just means
it will be something to make mobile later.

>
> What do you like for lighting?

It can only be flourescent- and built in to the bench in addition to
normal room lighting works best.

>
> Has anyone built power busses into your bench? If so, what was it?

A real bench has bussed line voltage with *LOTS* of receptacles.

>
> How about floor coverings? Ever drop a tiny screw or surface mount part
> on the floor and spend hours looking for it?

It always has to be thick insulating mats rated for 20KV, any IC dropped
on the floor is considered lost and not used, a screw is a different
matter, you shouldn't have to hunt for a hard to find screw, you should
be able to cut to length any replacement.

Better make space for lots of data books and a computer, fire
extinguisher, metal working machines, first aid kit, smoke alarm,
set-aside projects, file cabinets, and nice-to-get-to-later junk you
will accumulate. And make it so that every damned thing can be locked
up- especially the door to the lab, and more locks on all the storage
cabintes once inside, you may consider touch pad enable of all the room

receptacles, and installing an alarm.

When I was involved in off-line switchers I had a "panic button"
installed... one side-of-the-hand punch dropped the whole lab.

Plus a rule of no work unless a minimum of two people were there.

Same trick I used when I moved my parts cabinets from PA back to IL in
1980s.

Finally gave away my last old AkroMills metal cabinet (50 drawer) to new
amateur earlier this year.

Actually not a bad price at all ..... you can get one from Rockler
Woodworking for less than $20 .. these have been on sale for a few weeks...
great price for shop tool .. currently free with their router table. They
have a couple of local stores here in Chicago area
http://www.rockler.com/index.cfm?

I'm pretty sure the power switch in my China made small bench drill
press cost no more than about 15 cents.

Talk to your buddies in the industrial construction business. Or make some buddies over there. See if you can salvage the access flooring from a renovation project. I have about 400 sq ft of flooring, jacks and stringers that a contractor saved for me during a rebuild project at a local university.

I need about 20 more, but they don't make them anymore. I've been
using the crappy all plastic ones that shrink and jam. I'm about to the
point of putting the parts in plastic bags and driving over the damn
cheap plastic things.

Stanley Vidmar makes metal storage cabinets. They're rather pricey
though.

I think Akro-Mills still does, but they don't sell them through consumer
outlets. Try Applied Industrial Technology (ie. Maintenance America).

5622. FS: Collins gear

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-20 16:30:05 UTC
From: Avery W3AVE <acomarow@usnews.com>
Message-ID: <1135096205.323735.139980@z14g2000cwz.googlegroups.com>
Source record: 14662

The new issue of QST has a writeup of the 75A-4. If it made you yearn for one, here's a beauty. I also have a nice S-Line. There are no known issues with any of the gear other than as indicated in the descriptions.

75A-4: SN 1917, restored electrically and cosmetically in May 1999 by Howard Mills W3HM. Spinner, 4:1 vernier, 4.0, 2.1, 500 Hz filters. The 500 Hz filter is from an R-390A, adapted to plug in. All Black Beauties and out-of-tolerance components were replaced, the chassis and cans were cleaned and polished, the power transformer and filter choke were repainted, the cabinet and front panel were bead-blasted and repainted, new labels for all controls were silkscreened, the drum decal was replaced, and Collins service updates (e.g. removing B+ from the mechanical filters) were implemented, along with various improvements to the AGC and elsewhere. All work documentation is included, as are two original manuals, one from October 1955 and one from July 1957. No idea which one actually goes with the receiver, but considering the mods and updating I'm not sure it matters. Price: $1600 OBO.

A charge of approximately $55 will be added for foamed-in-place packing to protect the receiver in transit. Shipping charges are additional. The individual S-Line units are lighter and would cost less for each, but there would be four separate charges. Alternatively, I will deliver within 50 miles of Washington, D.C., or pickup can be arranged.

Digital photos available.

270-G2 Mort Jones repro matching speaker, very good condition, $225, or $175 purchased with 75A-4. Will be shipped conventionally, no foam-in-place.

Digital photos available.

S-Line:
75S-3B, winged emblem, serial no. 16957, CCA VG (top left corner of front trim ring has a small scuff; finger ring needs bare spots retouched; small mark at top front of cabinet). One 2.1 filter.
32S-3, winged emblem, can't read serial number, CCA VG in appearance.
516F-2 power supply, in round emblem cabinet. CCA VG (trim ring slightly yellowed). Warranty stub still on power cord.
312B-4 control unit, winged emblem, CCA VG (scuff mark at top rear corner of left side).

All manuals included. Riser feet supplied for receiver and transmitter. Buyer of the entire combination also gets a complete set of new interconnecting cables, including interconnect for 30L-1 and a

never-installed Dave Ishmael dual-fan cooling add-on for 32S-3. Price for all four is $2200 OBO.

A charge will be added for foamed-in-place packing for all units to protect them in transit. I'm guessing that the cost will be approximately $40-$45 per unit, but will have to check further. Shipping charges are additional. Alternatively, I will deliver within 50 miles of Washington, D.C., or pickup can be arranged.

Why not ask B&W. The company (Barker & Williamson) has a Web site, and
it still manufactures inductors.

Charlie,

That would certainly make a fine Christmas gift for a CW guy. You're asking a fair price for a fine instrument.

I bought my father a Vibropex gold plated Presentation model for a Christmas present in December of 1962. (I think it cost $29.95 back then).

He became a silent key in 1997. But I still have the Presentation bug, as well as his old Vibroplex from 1924.

> It always has to be thick insulating mats rated for 20KV,

Though it creates static hell IME. I much prefer wood, it will insulate personnel from anything too nasty, but without the static. (avoid nailing wood to concrete, which conducts.) With floor insulation you have to keep fondling the benches as you walk along, else you build up enough static to get bit just from crossing the room. A real hallmark of poor design imho, yet seems to be industry standard here, including in labs working on ESD sensitive kit.

I guess antistatic mat or coating on the bench goes without saying. Not needed for metal benches, but they have their own risks. Coating beats mat imho. Mats warp, catch on an elbow, dont fit perfectly, deteriorate, etc.

> any IC dropped
> on the floor is considered lost and not used, a screw is a different
> matter, you shouldn't have to hunt for a hard to find screw, you should
> be able to cut to length any replacement.
>
> Better make space for lots of data books and a computer, fire
> extinguisher,

I might make that extinguishers (along the escape route), getting out of a stuff packed room in a fire can be no joke. If you're going for the have everything approach there's always heat activated sprinklers. Just dont make the mistake of using those extinguishers to save your stuff when you could be getting out. Your exit must _always_ be clear, the moment its threatened get out immediately. I'm told fire extinguishers are liable to kill more than save otherwise.

BTW put emergency lighting near the floor, not up high as is usually done. When high up, by the time the light gets to the floor where youre crawling out, its all been absorbed by the smoke. Put it at exit(s) so when you dont know whats going on or where you are - disorientation is a very common problem in fires - you can just crawl toward the light. If youre working in a detached wood shack, an axe by the bench that wil bust through the wall.

> metal working machines,

Yeah. If there are no limits, you might want one of those 3d laser gloop prototype making things. I forget the name but the computer scans the beams through a tank of gel, and a hard plastic prototype is born. Very pricey iirc, but sometimes worth it.

A runner is handy. If you need something you dont have, just call them and they show
up with it in 30 minutes etc. This is something thats not so hard to set up, as long as youre not in the middle of nowhere.

> first aid kit,

If its your own shack, tools of self defence too. Not just weapons, but lighting, recording kit, etc. I've found recording kit pays for itself with ease.

> smoke alarm,

make that 2.

> set-aside projects,

sheet wood that fits on the desktop. Put a sheet on before starting work, ad you can lift your whole project onto another shelf any time, and use the bench for another task. Multitasking.

Almost forgot, replace notepad with win32pad. Its the bees knees for information libraries. You can have 50 files open at once no problem, they open instantly, .txt format is (and more importantly will remain) 100% compatible, and so on.

> file cabinets, and nice-to-get-to-later junk you
> will accumulate. And make it so that every damned thing can be locked
> up- especially the door to the lab, and more locks on all the storage
> cabintes once inside, you may consider touch pad enable of all the room
> receptacles, and installing an alarm.

This is a good point, security. I like to modify locks, it makes almost all lock pickers unable to pick them. Lock pickers are mostly not that skiled today.

Its yet another advantage of cardboard boxes on wood shelving, makes it looks like a downmarket shack filled with junk. May not look flash, but it means you get to keep it. Probably more useful for self contained unguarded units than corporate workshops.

A PIR alarm linked to a _very_ loud noise is all it takes to scare a lot of burglars away. By loud I mean LLOOUUDD. Its funny watching the video afterwards too :)

Almost forgot, any workshop needs a sink, and many dont have them. And a microwave/fan combi oven. And everything else that enables you to keep working comfortably.

I've never solved that one, just have to move the stuff each time. But it reminds me of one thing: some kind of easily portable testkit would be very handy. One day I had no multimeter for some reason, and ended up using 3 light bulbs to measure V and i. It worked, got it sorted out, but is a situation one should not be landed in.

Ah, also a set of cheapo backup tools in the car. The finest tools dont work when theyre left behind, lost, stolen etc. You can only keep cheapskate tools in the car, anything better and they get nicked. Proved useful several times.

While doing research for an article on the Davco DR-30, I had the
opportunity to visit the design engineer for the Davco. He also did the
HQ-215 design and had 4 of the receivers in his basement- all prototypes.
One had a very "mod" speckled front panel- have a picture here if you'd
like to see one of them.

Holly Crap!!! You have anyplace I can get a pick-up truck load of money
for all these
suggestions? LOL

I like to build me a "play with my radio toys" bench not a do everything
Electronics Lab.
Some nice suggestions, but waaaay out of the average Hams pocket book I
thinks.

May need to plan what it is you really want the bench for. You could spend
the rest
of your life putting it all together and not enjoying the things you want to
play with.
After all, if you look at the ARRL Handbook; it would be nearly impossible
to have
one workbench to fit all aspects of Ham Radio. From QRP to Satellite..
Wheeew!
what a spread. Better think about it for a while first. Remember it's not
the one with
the most toys that wins.... It's the one who gets to play the most with
their toys.

Keep the ideas coming though, might be a few good ones I can afford on my SS
check. :-)

No suggestions for the apartment size cooler for the beer and a chair for
the visiting novice?
Er better make that a recliner.... some of my stories take a while. ie.
Rag Chew Award
Then there was the time......

I like wood benches for some of the same reasons.
I have been using a rubber static relief mat, that holds up
under high heat, and also has a natural curl, so parts
always settle back inside the mat, and not roll away.
This thing is great. I doubt if MCM still has a similar item.
The stock number on the mat is not currently valid.

I've been using color printers
more lately, for laying out various things, either building things
or fixing things. Having a circuit board, you can take pictures of both
sides, then flip one side, and you can more easily trouble shoot or
build things. Having a color laserprinter makes the process faster.

Having multiple benches is almost mandatory for certain projects.
I frequently use a Rubbermaid cart to put equipment on, and
work right there on the cart. You can always push the cart away, and
work on something else. Its also necessary sometimes for big
or heavy objects, even dripping things like water baths. Screws, etc.,

stay inside the carts tray.

A very bright flashlight held along the floor, will usually find parts much more easily than just looking around.

At home I have had "workbenches". but my number one work bench, was the top of a washing machine. Its a bitch when the screws fall inside.

CHELSEA Timemaster Clock

The 6" Timemaster Quartz Radio Room Clock

by Chelsea (Model 40101)

A rare opportunity to own a Chelsea special, non-catalog Government/Commercial clock.

New, factory fresh in an unopened, factory sealed box.

The Chelsea Timemaster is the pinnacle of maritime timekeeping - and this model features a Radio Room dial. This clock has been used for many years by the United States Navy in the demanding shipboard environment - setting the standard long before satellites were used for navigation - and still in use today.

This Chelsea Timemaster has a silent, high precision quartz movement as specified by the U.S. Military. It meets standards for vibration, temperature and humidity extremes. The accuracy of this quartz movement is +/- 1 minute per year. The Chelsea Timemaster clocks have passed U. S. Navy tests for accuracy, shock, vibration, temperature and humidity extremes.

The sinking of the Titanic resulted in the Radio Act of 1912 that required 24-hour radio watches. The disaster also led to clocks in the newer radio rooms featuring three-minute periods marked in red. That three minutes provided a silent period when only emergency radio messages could be transmitted.

These clocks had an extra hour hand which was set on local time; the regular hands were set at Greenwich mean time (Zulu) since all incoming and outgoing messages were so marked. The red segments radiating out from the center post designated 3 minute periods at the quarter and three-quarter hours to observe radio silence to listen for emergency broadcasts on 500kcs. Later models featured additional green sectors at the top of each hour and 30 minutes past each hour for the monitoring of the 2182kcs. distress frequency. The red marks in the chapter ring designated 4 second intervals to time emergency autoalarm signals used to activate alarm bells on nearby ships and shore stations during the sending of an SOS.

The Timemaster is suitable for use on the enclosed bridge, wheelhouse, and ships radio room, on any Government, Commercial or Pleasure vessel or of course, in any home.

Timemaster is not included in the Chelsea catalog. Produced under various contracts which offer limited availability to the civilian market, and available only through authorized dealers by special order.

This clock is available for immediate shipment to the winner of this auction. It comes in its Factory-sealed (unopened) box.

Features:

6" diameter Radio Room dial
Accurate 12 hour quartz movement (+/- 1 min per year)
Second register
Hinged front bezel
Second hand
Black phenolic case

In either case, stable temperature and low humidity are the key.
Component degradation/aging will still occur, as you would expect, but
you've minimized it via an optimized environment. The solid-state
equipment will fare the best, of course. If you could seal-pack each
unit, it would be an order of magnitude better.

Source record: 14693

Why would solid state equipment fare better than tube equipment? This be a true statement, but has nothing to do with tubes v. transistors.

Aluminum cabinets probably fare better than steel cabinets. Older tube equipment sometimes has rubber for dials or tuning mechanism which wear out after 60 years. And, things that are 60 years old sometimes become brittle. But surprisingly, often replacement parts can be found for the older tube equipment with less energy than the more modern gear.

Humidity is more of a concern than temperature. And, rodents can do an excellent job of destroying stored equipment.

Best to store your furniture and move the old equipment into the living room.

Last I packed up and headed down south for the winter.

I drained the pipes, filled the traps with antifreeze and turned the gas
off.

I have a house full of BA gear in Northern Ohio

Nothing was worse for wear. Wooden radios, Collins A line, war surplus etc.
all fared well.

It would be difficult, because no two home electronics workbenches
have the equipment or tools. That is why i have several benches,
including a couple extra that are stacked up in the corner for the next
time I get a batch of test equipment.

Having done some home hobby work in radio-electronics for, oh,
about 58 years give-or-take, I'll suggest some basics:

1. The Bench itself:

1.1 A possibility is the "butcher block" slab top, usually
made for an island in a kitchen. Finished or unfinished,
it can have your choice of legs added, attach shelves
above it, all fastened into the wood. Various sizes
are available, depends on supplier.*

1.2 Use a solid-core wood door blank with choice of legs.
Lumberyards carry those. Solid-core doors allow
fasteners any place along the surface. Avoid the
standard or hollow-core types. I gave a friend the
door I had (covered in celotex glued on) for model
aircraft building; he still does giant-scale R/C
still using balsa construction. No warping in it yet.

1.3 1-inch thick 7-ply (minimum) plywood can be had at
lumberyards and, for a slight extra fee, cut to size
you specify. Depending on size of lumber yard, can be
had with your choice of surface veneer, "finish one
side" (cheaper) or "finish both sides."

2. Bench superstructures:

2.1 Test equipment shelving or support for stacked parts
bins can be done from do-it-yourself wall-mounting
shelf units, bracket-mounted to rear of bench top.

2.2 Wall-standard shelving can have its standards mounted
on a slab of plywood (3/4" minimum suggested) attached
to back of bench top, shelves bought ready-made in
modular sizes.** Limited shelf depth to about 12"

maximum for modular shelving. Can also use plywood
cut to order but will seldom find standard brackets
to hold shelving deeper than 14".

3. A place to sit:

"Task chairs" such as are found at sales times at
Office Depot or Office Max, those usually adjustable for
height desired of bench top above floor. Various choices
of upholstery; plastic suggested to avoid solder splashes
sticking to woven fabric. Sales time prices around $40.

4. Convenient Parts/Tools Storage

4.1 Home storage containers with clear sides for visibility,
available from 10" widths to 18" widths (from Sterilite)
and are found in some food supermarkets for an average
of about $13 (Ralphs Markets in southern California).

4.2 Akro-Mills small parts cabinets. Three sizes available
now, all-plastic but sturdy. [they have a website too]
I have four of those in my workshop now, easily screwed
to a back wall of particle board and they have been
holding about 150 pounds of stuff for a couple years.
Price and availability is, unfortunately variable. I
saw mine first at an OSH sale, grabbed them while there.

* IKEA has lots of individual pieces for sale so their full
catalog is needed for detailed sizes. Six years ago I made
twin computer benches out of IKEA butcher-block kitchen tops,
using their legs for tables, added keyboard slide-out trays
using slides from Home Depot. The butcher-block tops finished
very nicely using just thinned sanding sealer but they come
very flat and can take cementing-on of melamine laminate if
that is preferred. IKEA has a website with most size details.

** OSH = Orchard Supply Hardware, a do-it-yourself store that is
in the southern California region. Their website isn't a
catalog but they do offer some do-it-yourself project ideas.
Lowe's or Home Depot have the same but the product lines they
carry are seldom complete...they tend towards certain sizes
of their products and product models (same for OSH). I do
know the local OSH has a good line of wall shelving; that
enabled me to build 39 lineal feet of book shelving on one
wall of our office at home.

Luckier than most home owners, I had a 13' x 13' center room to
play with, subdivided that in half, using "my" half for the
center workshop, making false walls and cabinets as well as the
bench itself (3/4" ply on 2" x 2" framing supports). Do NOT use
any vinyl top material as I did...it tends to hold solder
splashings and still reacts with masking tape (all-around-use
temporary fastener) adhesive. Avoid paint for the bench top

(useless in the long run). Bare wood okay and, if it gets too dirty, just use an orbital sander on it to take off the worst. Use good lighting. I have two double 4-foot flourescent units as the main lights, a "fill" light without hot spots. I had two long AC outlet strips but those managed to corrode inside and go phut. Surge-protected 6 to 8 outlet strips are all over the stores now at less than $10 each (I got a half dozen at $5 each on a local sale). Be alert. Bargains happen! :-)

Using up a pad of paper in planning is a good idea. I like 1/8" "quadrille" pads and do simple drawings in scale (for big things) to get the arrangements and sizes right. For benches, plan the heights that suit you, not the "traditional" heights which might have suited an old production shop. That and sizes available from vendors lets me plan fairly well the overall costs.

SOLDERSMOKE!
A SHOW FOR ELECTRONICS HOMEBREWERS!
http://www.ourmedia.org/node/123300

Topics discussed in SolderSmoke 11:
Video of Trivial Electric Motor. Solar powered station on 80 meters. Mike's new PIC-pong game. Coax traps for a 160 meter antenna. Understanding solid state amplifier design. Homebrew shows on the Discovery RealTime Channel. The G-QRP Superdrug radio project. Altoids and I-pods. Listen at: http://www.ourmedia.org/node/123300

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/123300

We hope you enjoy the program. Please send us feedback.

There's a pretty good book available that covers a lot of the basics:

"Build Your Own Electronics Workshop" by Tom Petruzzellis

ISBN 0-07-144724-5 (McGraw Hill Publisher)

Not the answer to all but gives you some pretty good ideas to use as
departure points as you put your shop together.

This is the kind of deal where you make up your own experience. You sit at a blank bench, and put your project in front of you, and go, "Now, where would I like my power supply, DVM, and scope be sitting while I do this?"

Personally, I like to have everything possible at my fingertips, so I go with a U-shaped bench, a chair on wheels, and two tiers of shelves for stuff.

So use your imagination! Make up the workbench of your dreams, custom-tailored to your very own personal specification. :-)

Have Fun!
Rich

Someone had a very good idea about finding dropped parts: vacuum the
floor occasionally* with a sheer filter (women's tights) stretched over
the cleaner nozzle.

Not the most anti-static solution imaginable, but it does work.

* Once every ten years, whether it needs it or not.

I'd lose track of whatever I was doing, and go play with the woman
who isn't wearing the tights. ;-P

Cheers!

FT/FS Amp Supply LK800 NTC TNY
Forsale Or Trade for ham gear etc.
Hi
I have a LK800 TNY NTC No tune amp
I bought it a month ago and spent 3200.00
Beleive it or not.
I see it arked on the high voltage board and I see where it is,
looks like a diode?? Anyway, I replaced the fuses
and it comes back on and voltage reads correct 3000 Volts
The softstart light now does'nt come on so I do have a new one in the
box to go with it. It needs work and I'm moving on because I have
another amp.
So again Make offer or trade offer.

Awhile back I stored a bunch of solid state gear in Houston. High humidity. Hot summer. Cold winter. Put two sealed plastic garbage bags around each item. Everything came through fine, stored in unheated, uncooled storage unit.

The individual parts in vacuum tube gear may be more subject to aging, compared to the internalized components of solid state gear (thousands of transistors embedded in a single chip).

If it's the kind that has the 4 screws in the corners, I would open it up
and sand it down the few KC's you are trying to get. Back in the novices
days, I always was able to shift the crystals quite a bet . You sand them
with a light abrasive to raise the frequency. Use something like tooth paste
and scouring powder. If you over shoot the frequency, rub some pencil led on
the crystal. If your careful, it's not that hard and you can just about
figure out how many 'strokes' you need to shift it to your frequency.
Anyway, it don't sound like you have much to loose, as you have a crystal
that's close but can't be used.

Ah, brings back memories.

You're not alone, Gary.
Five years ago, we had a paided-off home and were
"sitting pretty." After several medical disasters,
we've lost everything.
The damn Medical Mafia extortion racket-
and that's exactly what it is-
is going to bankrupt us all.
They whine and cry about how they can't make it,
but look at the cars they drive and the homes they live in.
The hospitals grieve and moan about how they're going broke,
but you walk into their lobby and it's decked-out
like friggin' Windsor Palace; it's obscene.
Look at the salaries and bonuses of hospital and drug
company boards; interesting, for people who paint
themselves as concerned and caring about the sick.
The drug companies sell a pill in Canada for $1 and
sell it here for $50. They don't do that because
they love Canadians; they're making money at $1
or they wouldn't sell it for $1 anywhere.
They do it because *they can;*
they have us "over a barrel."

I don't mind people who work hard to make a good living.
I *DO* mind it when they do so under false pretense.
It makes them liars and thieves and extortionists,
and that's *exactly* what they are.

I hope that God has mercy on you and yours,

D.S.

3 more things cross my small mind.

Adjustable mirror, a must have for working on fitted pcbs, so you can see both sides. Also a light shone through the board is handy - but not an anglepoise.

Someone mentioned painted benches: my best one was joined painted steel benches, and I had no problem with the paint finish. It all depends on the type of paint. But I prefer wood to metal, its safer and doesnt short things.

Someone also mentioned the question of social security budget workshops. For these, sheet wood on the bed makes a put-away-able workbench, shelving units can be made from scrap wood, but the one thing I would most recommend for low budgets is a melting pot. With one of these, you can get lots of components off scrap equipment boards, and avoid a lot of part purchasing.

Oh, for visitors: instead of using box numbers, use box names. And make 'em gory :) Brains, best.
Brains, reject
Necks
and other things I wont mention

NT

Well, VOX tube,6fq7, replaced (boy, they can be costly) along with two others in same section without luck... back to the drawing board. I thought it was going to be an easy swap. Will recheck relay and then on to voltage checks (seems like heat condition)

When I was in college I worked nights as a security guard in a "non
profit" hospital. I had to go into the administrators office to check
it out on my rounds and couldn't help seeing the map of hospital
property on the wall. They were making so much money they had to get
rid of some of it so they were buying up all the property in that part
of town. They were buying beautiful old mansions and tearing them down
to build parking lots. Of course that took it off the tax roles so we
all had to pay higher property taxes. They would never dream of
balancing the books by reducing prices.
After all shouldn't everyone pay $20.00 for an asprin tablet?
73 and Merry Christmas to all.
Gary

Sorry to hear of your problems there.... but your sure not alone.

HERE'S A HEADS UP FOR THE NURSING HOME BOUND SOMEDAY!!!!

I had been caring for my Mother. She was diagnosed with cancer in 2002.
I wasn't aware of this till I was at the local "Community Services" signing
Mom up for her foodstamps at the time. I saw in small print at the bottom
of the form.... "if you are applying for nursing home assistance,,,bla bla
bla
... for up to 30 or 36 I forget. The state can take property belonging to
the
person needing nursing home care.

I am glad Mom found that the State will come and take property of anyone
being put in a nursing home under Medicare or Medicaid (Tenncare in TN) for
up to 3 years prior to that time. Means they can take the house and cars
from kids. Like stealing from the dead. Mom had the Deed changed on
the house 3 years ago in September so she beat them out of it. Horary for
Mom! I didn't know that till I came down to help her out. She had signed
Power of Attorney for my brother and I in 2001 incase something would
happen that we needed to sign checks and such. When she was changing
the Deed over to me, I had her sign herself so family couldn't come in and
sue, claiming I took it away from her. She made it to me with her having
life time rights to live here. Wish it could have been longer, but glad we
had some time together.

SO!!! If you plan on leaving something to the kids or whom ever.
Better do it at least 3 years before you need your nursing home care.

Mom passed on 16 November 2005 after just 4 days in the nursing home.
I was able to help her stay at home till her 24 hours a day care surpassed
my ability to assist her. Also, some places can force a nursing home
prospect
patient out of the house if it is decided that the home care puts the
patient in danger. "Endangerment of a Dependent" Heil Hitler!!!???

I recommend everyone check their state's laws. Might get a surprise!!!!

Nothing new here but I have heard the number 7 years instead of the 3
years you are taking about. In defense of the nursing home though is
that after your money runs out they continue to care for you for as long
as you live. I know people that have been in nursing homes for over 10
years and didn't have that much money when they went into the home.
When my grandmother went into a nursing home in the early 60's the
state of Minnesota had a sale of her estate which included her house.
She was in the nursing home for over 15 years so it ended up a better
deal for her children then if they had tried to finance her stay and
have kept your estate.

I fully understand the inequality in our society but the money has to
come from someplace. So I think the person that is in need of help
should have their estate used first before that State takes over. Let
the children find their own way.

"Endangerment of a Dependent" is really required being there are so many
greedy don't give a shit children out there that are little Hitler's
themselves.

Hi Tom,

Don't forget to take a look at the cathode resistor bypass
electrolytics in the Vox/relay driver section. They don't stand up
well to the test of time. Typical values are 10uf 15V. When they go
bad, the T/R relay will start to conduct partially all the time, which
can make even good contacts iffy.

It is (as I said earlier) highly unlikely to be a tube. Tubes are usually
an all or nothing affair.

I have cleaned the original relay in several TR-4Cs without
success, Tom. Gary, K4OAH sent me the info on a fix.
You can get a plug-n-play replacement
that has gold contacts and works well for $17 plus
shipping from:

P&B R10-E1-Y4-V2.5K.

Mouser has them in stock 655-R10-E1Y4-V2.5K
<http://www.mouser.com/index.cfm?handler=displayproduct&lstdisppproductid=214416&e_category
id=155&e_pcodeid=65500>

They solved my relay problems.

In the Drake TR-4 (no "C") and the TR-3,
the same relay will replace to
cheap white piece of junk Drake supplied,
though it must be soldered in.

P.S. "Hanging" relay is often a bad 6EV7.

Hi Gang,

Yes, that's what's in there now... I knew it was fairly new.
Digikey carries them also for about $16.

Anyway went back in and started to get some pin voltages on the Vox
circuit tubes... stupid me got a small shock (not use to these tube
rigs!) and went to repull the relay.

Had prev cleaned them and this time found a sheet of wet/dry paper 1000
grit... fiq I'd gently redo the contacts (hell the relay is cheaper
than tubes!).
While it was out I ran the relay by an outside power source... looked
like one or two of the contacts were mis-aligned... fiq I could get
another so I put on the Opti-visor and reset to what looked like the opt
setting for both contacts.

Well darn if it seems to be ok now! I'll put a relay on order but for
now after 2 1/2 hours its been FB

Happy Holidays

NOOOOOOOOO!!!! Don't do that! You will ruin the relay for life!

Bad! Bad!! Bad!!!

Seriously, the emory grit will embed in the soft relay contacts, and
will make a bunch of little nonconductive boulders that are certain to
mess the relay up.

The way to reform relay contacts is what I told you before. Take an old
hacksaw blade, and grind the flat sides on a course grinding wheel. (The
steel is too hard to have grit get embedded into it.) The fine scratch
lines that are left in the steel are perfect for burnishing the contacts.
If you don't have a grinder, a whetstone, or a diamond sharpening stone
will do just fine for scratching up the hacksaw blade burnisher. Take the
paint off of the blade first, though.

fiq I'd gently redo the contacts (hell the relay is cheaper
> than tubes!).
> While it was out I ran the relay by an outside power source... looked

That sounds like the real problem. Relays are made so cheaply these days
that alignment is seldom optimal.

While your suggestion is good for many boatanchor relays,
Chuck, this one has pretty tight contacts- I don't think
the blade would fit.
Hardly worth the effort, considering you can buy
one for a few bucks that has gold contacts and is
specifically designed for comm work.

Hi David,

I agree, it is best to replace, if a replacement is available.
When I use a hacksaw blade, I grind it to whatever thickness and
width I need. I typically grind to about 0.010 thick. (which takes
so little time on a bench grinder that you have to be careful)

In any case, the big point I was trying to make, is never, ever
use abrasive paper to clean up the contacts on anything. It will
cause the contacts to arc and burn from that point forward.

Thanks Chuck /Dave...

But to be honest, I fiq it was worth it. The problem kept pointing back to the relay! As a new relay (which I'm ordering) was only $16, I wanted to eliminate the relay as a problem once and for all... as tubes were much more costly.
And I did reclean them with alcohol after.

But maybe it was more of an alignment of the contacts in the end that was also effecting it.

But the Drake is working fine, will swap out the relay soon and keep in the spare pile along with several nos tubes.

Happy Holidays to all
Tom

The good ole' style contact burnishers are still available. See:

http://www.hmcelectronics.com/cgi-bin/scripts/product/6440-0002

You can Google up a search for contact burnishers and find many
examples. These are a MUST for old boat anchor equipment!

According to my DuMont handbook of CRTs, a yellow filter can be
used with a P7 phosphor CRT to allow viewing of the long decay
part without being "blinded" by the bright blue trace. I've searched
Ebay, Sphere Research and other sites looking for these.

Anyone have one good for a 3" round CRT or know of a good substitute
material (perhaps from a hobby store)?

TIA,

Steve.

Look up your local theatrical supply house in the phone book. See if they are a Rosco dealer.
http://www.rosco.com/us/retail/index.asp

Rosco makes sheets of gels in many different colors. There must be one close enough for what you want to do. Plus, they are very robust in that they have to stand up to extreme heat.

I am maintaining a listing of basic tune-up charts for all HENRY amplifiers.
The purpose is as a starting point for those who buy a used Henry or have
lost their basic tune-up settings and want to be "in the ballpark" to start
tuning.

If you have a Henry amp and want to submit your tune-up settings, please
contact me with your amp model and information.

See the webpage below and if your model is not listed, I need your chart!
Also, let me know if it is OK to give you credit for your chart or if you do
not want your callsign shown as the contributor.

The webpage is located at http://www.radiodan.com/ampsum/Henrytune.htm

I need some 1/4 " tuning slugs for an old Hammarlund HX-50. They are just a threaded screw with a hex hole in the middle - you know the ones I am talkin about. I got at least one thats all crumbled. I'm not sure of the material but I would guess Powder Iron. Please tell me where I can get off of the internet. I don't think the permeability matters too much. Probably a ferrite or a powder iron would work.

I can also use some 1/4" x 2 1/2" coilforms with the slugs and I will wind my own transformers. I need to add the 160m option to my HX-50. Why Hammarlund didn't just make 160m standard will always be a mystery to me.

I always like to tell this story :) In the mid-70s a lot of Hammarlund's surplus stock wound up at a surplus dealer in Charlotte. The 160 meter coils were stacked up there by the 100-box...I think there were 3? different coils? I bought one of the hundred boxes (I also needed spare slugs) plus a couple of complete sets for my HX-50A. Oh, they had the crystals too! I don't recall the haul costing more than a coupla bux.

I know thats painful to hear but its one of the few times I've ever been lucky at finding unobtainable parts!

If you need some coil forms and slugs don't hesitate to chop up a couple of old plastic clock radios and use the innards from the IF coils as fodder. Or if you want the 'like-original' clip-in-the-hole forms keep an eye on ebay for someone parting out an old Heath rig of some sort.

Good luck in your quest,

-Bill

Theatrical lighting gels should work fine. Try a theatre supply store.
Ask for a "bastard amber" gell, or a "#13 straw." Gels usually come in
both wide rolls and small squares that should be fine for a small CRT.

Another thing I've run into in refurbing a bunch of TR-4s and
TR-4Cs is intermittants in the tube sockets.
The tube pins get oxidized and this causes no end of troubles.
Even in the final cage- I had one that kept acting weird until
I noticed that one of the finals no longer had a filament!
On some of the sockets- especially in the receiver front end
and the modulator- it took De-Ox-Id on the tube sockets
and tube pins to fix the problem.

Personally I have had more problems with solid state gear coming out of cold versus uncontrolled storage than I have had with tube gear. I stored a huge lot of vintage and newer gear for 5 years in an uncontrolled environment and some other gear in cold storage (sealed but not seal-packed in visquine with silica gel packets inside). In both cases the only problems I had were with the solid state stuff ..those infernal, goll-durned phenolic circuit boards. I'll put my money on the old tube stuff. I liquidated the solid state stuff and kept the tube stuff and its all been working flawlessly for 3 years at this QTH.

Folks, I just acquired what appears to be an early NC-183D receiver and got it back on the air via 100% re-cap and a handful of resistors. My tech library copy of the book is (I'm assuming) of the mainstream production model; that is, a 6SN7 for the S-meter and audio phase inverter. This receiver, of course, has the miniature tubes in the IF chain but retains the older NC-183 6J7 phase inverter, etc. No big deal, but I'd like to (at least) have the correct schematic. Thanks for any leads.
Happy Holidays to all!!!
Jeep/K3HVG

5711. Need help with CE 20A Undocumented Mod

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-26 02:03:06 UTC
From: Ron H <rnharsh@attbi.com>
Message-ID: <GbIrf.22020$SV4.20115@fe14.lga>
Source record: 14500

Hi All!
I am in the process of rebuilding a Central Electronics 20A and seem to have an undocumented modification. As far as I can tell all of the mods noted in the BAMA site are installed and complete. There are however two 5 amp diodes in series with the anode end grounded and the cathode tied to pin 1 of the 6AL5. The junction of the two diodes is connected thru a 33pf cap to the junction of C42 & R77. None of this makes sense because the #1 cathode (pin 1) of the 6AL5 is only normally at -.5 volts and couldn't provide enough voltage to forward bias the diodes. The junction of C42 & R77 is at -100 volts in stand-by and ground for transmit. Since the undocumented 33pf cap is polarized with the cathode end at the C42-R77 junction, I suppose it could charge up to the -100 volts and serve some sort of spike suppression when switched to transmit.

Anyone familure with this mod? Can you explain it?

Thanks
K3PID Ron H.

5712. Harry E. Landsberg, Jr., CIA Maltese Falcon: Kennedy assassination, IRAN/CONTRA, UFO's

Harry E. Landsberg, Jr., CIA Maltese Falcon: Kennedy assassination,
IRAN/CONTRA, UFO's

My late father, Harry E. Landsberg, Jr. is apparently one of the 35 CIA
Officers memorialized on the north wall of the Original Headquarters
Building lobby whose "names ... must remain secret, even in death."

Please see:

http://www.angelfire.com/journal2/landsbergphotos2/maltese_falcon_search_terms_maltese_falcon_cia_dot_gov.jpg

taking note of the search terms "maltese+falcon."

Then:

http://www.angelfire.com/journal2/landsbergphotos2/maltese_falcon_cia_dot_gov_memorial_wall.jpg

and

http://www.angelfire.com/journal2/landsbergphotos2/maltese_falcon_cia_dot_gov_memorial_wall_2.jpg

---

I was discredited as being mentally ill in 1981 and again in 1985. As
a result I was motivated to research family matters.

In 2004 I learned that my husband, Richard Hanning, Jr., was a
Marine/covert operator assigned to me. We met in 1985 and I knew I was
a target when I met him. I just didn't know I was his target.

We are divorced. My life has been in danger and I have been revealing
information about my family and their associates as a result.

Please see:

"Harry E. Landsberg, Jr. -- resemblance to man in photo with Specter"
http://home.earthlink.net/~lhann10243/index.html

and

"IRAN/CONTRA: Fleming O. Landsberg, Fleming Landsberg, U.S. Ordinance
[sic] Inc."
http://home.earthlink.net/~lhann10243/id85.html

and

"Landsbergs and Maddens -- Mirror" (UFO's)
http://www.angelfire.com/journal2/landsbergphotos/Landsbergs_and_Maddens_mirror.html

---

I am a survivor of satanic ritual abuse and mind control.

Please see:

"The Love Game"
http://home.earthlink.net/~sammark4/id2.html

and

"Scars and other signs of mind control"
http://home.earthlink.net/~sammark4/id5.html

My legal mother, Donna Jean Volkmer Landsberg, worked as secretary to
the Undersecretary of the Navy in the 1940's, likely James Forrestal.

He died under mysterious circumstances. Please see:

"The Death of James Forrestal" by Richard M. Dolan
http://keyholepublishing.com/Death%20of%20James%20Forrestal.htm

---

I had a vision of Donna as a three-headed bird (black heads.)

I was searching for photos of Vanessa Redgrave and found this photo
which was similar to the bird in my vision:

http://www.angelfire.com/journal2/landsbergphotos2/donnas_bird_head_more_like_this.jpg

Then searching on "Maltese Falcon" I came across "The Virtual Tour of
the CIA:"

http://images.google.com/imgres?imgurl=http://www.cia.gov/cia/information/
tour/83stars_lg.jpg&imgrefurl=http://www.cia.gov/cia/information/tour/
stars.html&h=465&w=600&sz=184&tbnid=fQ8WESE-YHkpWM:&tbnh=103&tbnw
=133&hl=en&start=130&prev=/images%3Fq%3D%2522maltese%2Bfalcon
%2522%26start%3D120%26svnum%3D10%26hl%3Den%26lr%3D%26sa%3DN

or

http://www.cia.gov/cia/information/tour/stars.html

There is no mention of the words "Maltese Falcon" on the page.

There was a Divine Intervention in late 2003 and I have been protected
as I have been enduring harassment in the astral plane.

5713. No link attitude!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-26 04:22:39 UTC
From: n9zle <NoSpam@nospam.com>
Message-ID: <jeKrf.37456$dO2.20874@newssvr29.news.prodigy.net>
Source record: 14502

No link attitude!

http://www.n9zle.com/forum/

What is it with this no-link to other site attitude?
Years ago when the internet was in its infancy just about any site would add your site as a link from theirs. In return you would do the same. But now it has come to NO-LINKS. Not even in the forums. I have had a website located on tripod for about 9 years over those nine years I had a link to qrz dot com That site received over a million hits. And many users went from that site to qrz and on-to Icomamerica dot com. I have always supported Icom. They have never given a link on their site to mine. I have always supported qrz. But of course he(AA7BQ) never put a link on his site to mine. Well you may say that "I never asked". And that is true. But recently I have noticed he has been deleting my posts. ALL OF THEM. He never contacted me telling me why. AA7BQ just deleted them. I build CIV cables and sell a few of them every week to amateur operators who want them. When I posted one on his site. I found he deleted the post soon after it was placed there.

My beliefs are.
1. QRZ AKA AA7BQ no longer has the amateur radio attitude.
2. AA7BQ has gone fully commercial but calls his site "The Ham Radio Super Site"
3. AA7BQ does not have your best interest in mind.

I can also prove what I am writing here.
For one if he claims he is nothing but a commercial site then why does he ask for donations?
If he is not a commercial site than why will he not allow me to post my CIV cables on his site?

That takes care of number 2
Now for number 1 and 3. If some one knows the truth about something but keeps it from you he is a liar.
No mater how you put it, he is a liar. On the QRZ site Fred is there to help you renew your license. Or so he leads you to believe so. He charges you for it. Mr. Lloyd has never revealed it to any amateurs that you can renew your license or do an address change at the fcc.gov web site for FREE. Yes TOTAL FREE at the FCC web site.
The forms at the FCC web site or no harder to fill out than his.

His CD. He charges 24.95 plus tax and shipping. On that CD is data he obtained from the FCC and got it for FREE, he sales it to you. Also he has software, created by programmers like MYSELF. And MODS that have been made available from the manufactures and other HAMS like ME! I have been contributing to Amateur Radio community for greater than 10 years, and have

received very little for software I created. Never complained when it was copied. I have performed and created several of the MODS for various transceivers. Never asked a penny for it. I never commercialized HAM RADIO. And NEVER took money from some one for something they could get FREE else where.

I am sure many of you would like to ask me "what I am going to do about it?" Here is my answer.

I have created an open forum on my web site http://www.n9zle.com/forum/

There you can post a link to your own site even if it is a commercial site. You can post any ham radio equipment you have for sell on the site.

You can do a callsign lookup at my site from the FCC database, not that stupid qrz thing.
I will soon put together an open source database that I will sell for the price of the CD plus the true cost of shipping. About two bucks total. Once you install the database on your system, you will be able to download updates for FREE. I will make drivers available to programmers to access the database in several different languages and operating systems. I will also attempt to make the database available on the internet for FREE to download.

I only ask for a little help from other HAMS like myself. I need a few elmers that are willing to moderate some of the forums. It is easy and you will find it fun. If you have any suggestions on new forums or sections please logon to my site and make a post.

Slowly. The problem is that video is going into a proprietary chip
on the aperture board, and not coming out. I put the thing on the
shelf for a while; I should really try touching up all the solder
joints.

It does seem to be that stage rather than any of the RLC filter stages.

I _do_ have an "official spares kit" for the 650... but the aperture
chip is specific to the 650HR.

Ron,

None of that makes sense to me . Pin 1 (cathode) of the 6AL5 would be a modest DC level that varies with speech level and actuates the VOX relay tube. And 33pf is too small to couple anything but a very sharp transit spike from the junction of C42 and R77 as the rig switches to standby.

I would remove those added components.

My factory wired 20A that I acquired (used, of course) in 1964 is still my main station exciter and has no modifications whatsoever. I had to replace R45 several years ago as it's value creeped up and I really had to holler in the mic to get the VOX relay to pull in.

The really (really) old marine radars had such a filter, the RCA, some of the Decca, and similar post WWII radars are mostly in the junk pile by now, but any old-time marine radar repair shop will probably have old displays that seem a shame to junk. I suspect some of those places might pay you to haul off the entire display (including the filters). Seems like the filter for that phosphor had almost an orange cast to it, no?

Old Chief Lynn

Hi,

I don't know of a source for you, but I wanted to mention
that Heath used exactly that system (P7 phospher CRT with yellow filter)
in the SB-620 "ham-scan" spectrum analyzer (3RP7 CRT).
The earlier HO-13 ham-scan used a 3RP1, but also used a yellow filter.

Message-ID: <Lcjsf.1435$D43.843@trndny06>
Source record: 14511

I am restoring a Hammarlund HX-50 for a fellow ham. The BAMA schematic is...quite bad. I am having trouble tracing and verifying the components of the unit. The rest of the manual is rather good in DjVu format. The owner has a reproduction manual on order and we hope it has a better schematic.

In the mean time I would like to get started and order caps, resistors, etc. Could a kind soul please email me a copy of the schematic? Also my parts list resistor section starts with R165. There seems to be a missing BAMA page in between pages 43 and 44.

Also, is there a better forum for such a request?

Thanks to all,
Paul
www.ppinyot.com

BTW - if you would like a stand alone (not plug in) DjVu application go to: http://www.tuberadio.it/utils.htm It is slick. I have combined many jpgs and gifs into a single file. The resolution is surprisingly good for the overall compressed file size.

5723. Re: SS Rectifier conversion volts drop

Source record: 14512

Bob,
Yes.
I happen to be restoring an HX-50 at this time. I believe the rectifier tube is a 5R4GYB. The specs can be found on an application at: http://tdsl.duncanamps.com/ (I use it a lot); There is it specifies a voltage drop of 63v at 250ma DC. Also PIV=3100; I Cathode is 715ma max; IRect is 250ma; RMS input is 900-0-900v. Also see ratings chart at: http://tdsl.duncanamps.com/pdf/5r4.pdf . The final setting of the resistor will ultimately be determined by obtaining the proper B+.

Some one did the same thing to the unit I am restoring. So I will be doing the above exercise too.

Were did you get the 500 volt electrolytic?

I hope this helps.

Paul P.

PS - I'd like to hear about your experiences. I am trying to get a clean schematic. BAMA is missing significant parts of the schematic art work around the Power supply 5R4.

Al,

Thanks for the information. I will follow up on the web sites and forward
this conversation to the HX-50 owner.

Paul.

5728. Re: Yellow filters for P7 phosphor CRT.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-28 16:36:38 UTC
From: rcavictim <stephensrw@stn.net>
Message-ID: <1135787798.060914.139810@g14g2000cwa.googlegroups.com>
Source record: 14517

All the equipment I've ever acquired with a P-7 CRT in it has employed a orange optical filter, sometimes solid tinted plexyglass, sometimes a cinemoid gell. This includes a number of really old marine radar sets and some vintage hospital diagnostic displays including the exact same heart monitor that can be seen on the movie "The Right Stuff" while the would be astronauts are being run through the meat grinder at the testing clinic.

As an interesting aside, I also had the exact same motorized positioning chair that appeared in that movie too! Part of my chair, a heavy gearbox motor and speed controller board ended up as the motion engine driving the RA tracking (azimuth) feed car on the famous Big Ear radio telescope of John Kraus at OSU in the 1990's when I was working with that SETI project.

5729. Re: Yellow filters for P7 phosphor CRT.

>material (perhaps from a hobby store)?

The trusty Wratten 85B (I think) filter used to convert daylight to
tungsten-equivalent lighting for photograpic work is probably about
right. (You want the lighting grade, not the camera filter grade,
as it's a lot cheaper.) Or any suitable stage lighting 'gel' - for
best results, get one that is an exact match for the afterglow, as
that will give you the brightest trace while still knocking down
the blue component.

Tinted Perspex (Plexiglas) may also be worth a try, or even the brown
cellophane you get in some chocolate boxes, sandwiched between two
sheets of clear plastic of glass. (I won't suggest rolling your
own filters out of gelatine and food colouring.... Yet!)

Hope this is some help,

Chris.

I noticed the reference in meow2's posting the question of budget workbenches. If anyone is interested, I have 2 references to simple, inexpensive workbench designs that I have used successfully. Both are made of plywood or similar material.

A small, but very useful one can be made from a 4'x4' (half sheet) of 3/4" plywood and provides a 24"x40" top. I built one of these for my wood shop using cheap plywood, though MDF would do. The second has a 28"x65" top and is cut from a full sheet. I used 3/4" MDF for this and it works great as a desk or as a work table.

As the designs are in published materials, I don't feel right posting them to a site or a NG. I would be willing to respond to an email at: -... -- -... ..- .-. . ... @ .-. --- --. . .-. ... .-.-. -.-. --- -- (If I'm posting to who I think I'm posting to, you won't have trouble figuring out my email id. If you can't. please don't flame me for being too clever, but ask and I will find a different way.

(see quoted material at end)

Years ago I could not understand very well how people would spend large amounts of money and time on old cars (eg. Ford Model T, etc). Now that I am older myself, I can better appreciate the nostalgia value of such pursuits. There are lots of pursuits out there that have novel and priceless value to the pursuers. Birdwatchers, for example, have been described as fanatics.

In recent years I have sought, and obtained, great pleasure working on that old "obsolete" tube gear and that includes building gear from junk, spare parts, etc., out of the junk box. For many, who could not afford this stuff as a kid but always wanted it, now maybe they can afford it even if they don't fix the stuff. So, as this stuff becomes an "antique" there will be a progressively smaller fraction of the population that will pay what seem to be progressively more outrageous prices.

That old tube gear, however, wasn't all that bad, especially for HF frequencies, and beyond that new solid-state gear, it is much more repairable (because they were built of discrete devices instead of chips, some of which are no longer available, and the circuitry was before today's scale of ultracomplexity and ultracompactness). You generally don't need fancy equipment to fix the stuff.

Yes, eBay (etc), is the great attractor and auctions play on our psychological weakness that our "wants" force us into bidding wars to satisfy our wants; I've looked for a few old boatanchors myself and see what is essentially junk (with many statements of "as is", "the tubes light up, that's it" or "I have used the rig") and you wonder if its salvageable to functionality or you can only "talk about owning an X" rather than using it, and the "fixer-upper" status means that after you paid an outrageous sum of money for it, then you have to spend an outrageous sum of time and effort to restore it and that may also mean more money yet). Then there was the guy who said "I hooked a wire to the receiver and heard 18 stations" as if that tells me much besides its not dead. Me, after spending an outrageous amount of time on eBay, and getting snotty, arrogant answers to questions and inadequate answers to questions) I'm going to be going to more hamfests and actually look at, lift up the lid, talk to the guy (for history and price), evaluate the whole thing on the spot, and then arrange my own transportation (the back seat of my car) back home so at least for that part of the trip I know what is going on.

Another thing: I'm going to crack that ARRL handbook and that Bill Orr handbook for receiver circuits and just build my own.

I see all these fancy rigs with two VFOs, readouts, multiple digital meters, scopes, TV screens, a couple hundred knobs and buttons and you sometimes can't run them without reading the manual [if its readible]. To me, it's not real ham radio. Its an "appliance operator" hobby. I can take just about any receiver or transmitter made before they got complicated and figure out how to adjust all the knobs and switches to receive stations, and talk to them, just by reading the label on the knob. What is going on, functionally, is much easier to decipher if you look at the schematic. I like all of that.

$1000 for a 75 series (or similar vintage) Collins rig? Yes, I've seen them at hamfests with that price on them. I saw a Hallicrafters SX-88 (very rare) receiver get a written bid of $5,000 in a silent auction at one hamfest. Nice for rich guys or guys who don't know what else to do with their money. But, spending a bunch of money on such an item is, to me, also not ham radio. Oh, yes, I've had a lot of those solid state rigs, too, when I was younger. These days, I'm having much more fun with the old tube gear, both restoring (a little) and building (a lot).

To each his own.

Licensed ham, since Novice days in 1960.

Yep. I paid more than $1K for an all-Collins R-390/URR reworked by
Rick Mish, and I _love_ it. It's not computer-controllable, nor is
it frequency-agile. It doesn't know about FM, it takes a bit of work
or an adapter hung on the IF to get good SSB out, but it's a genuine
marvel of design and construction the like of which we probably shall
not see again.

A 51J4 is a little brother to an R-390, and a really nice RX, and yes,
it may be worth $1K to someone.

Were these the two that belonged to Joel (from RF Connection... the rack sure looks like the one!!!) If they are, you should have seen them before restoration!!!

5748. FS Yaesu FT-102

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-12-31 16:34:20 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <Kpytf.46470$ih5.37592@dukeread11>
Source record: 14537

I have a Yaesu FT-102 HF Transceiver for sale. This one was Malcomized by Mal, NC4L in March of 1997. It has had all of the relays replaced plus other upgrades performed by Mal. It has a CW Filter but no AM/FM Board. Cosmetically it is in good but not mint shape. The cabinet looks good and the front panel is nice. There are some nicks and scratches mainly on the trim around the front panel. It works but has problems. On bands above 20 meters, sensitivity is low as is power output. It loads up to over 100 watts on 20. On 40 meters the VFO does not change frequency. One meter lamp is burned out. Price is $425 plus shipping. No mic or manual. Thanks, Charlie Hugg, K5MBX

Folks,
I got one mike with such model number which has a transistor
preamplifier. (It is marked Harris)
Does anyone have a copy of the specs and connections????
Thanks

jon, ea2sn

It ended up going for $1525 in fairly active bidding.

Decent condx that may require some work and with Owners Manual & hand mic.
Could use power supply speaker with it.
I have HG-10 & DX-20 both very decent condx as trade / part trade. Prefer
xcvr due shack space.

Anyone have a schematic for this old (1950-ish) scope? Or a link?

TIA.

Steve.

Help: Ameritron AL-82 blown fuses
I bought an Ameritron AL-82 and it sat for over a year.
Worked perfect before that. Now when you turn it on
the two fuses on back of amp blow. So I replaced the two fuses
and this time I left the top cover off and it comes on. No problem.
The minute you pust the button down where the top cover goes on, it
will blow the two fuses again. The button is a safety feature.
Can someone tell me what I may need to check and replace?
Thanks and Happy New Year.....Rich

I received an early Hallicrafters SX-28, but the rear antenna and speaker terminals were punched in during shipment. They are made of what appears to be black bakelite, with antenna terminal pair having A1 and A2 marked on it. One speaker terminal pair is marked with 500 and the other 5000. Anybody got a line on these terminals, or a junker SX28 for parts? Thanks, Doug

Yep!, check the filter caps. Whan ever you let equipment set like that you normally have to reform the electrolitic caps. Use a variac and bring up the voltage slowly. If your lucky they will reform, if not replace them.

Anywhere from $500 to $800 typically, depending on condition, more if
"museum quality". Check ebay prices.

Thanks Jim, and others that have replied offline. They are not "Museum Quality" by any means. They appear to have been taken out of service. The 390 has a nice looking panel and the 390a has a few scuff marks. Both are relativly clean inside, but have a small amount of grime from age on the chassises. The megacycle and kilocycle dials work easily on both radios. (I wonder if they can copy signals in Megahertz :>)) They both are missing the tube shields that I remember from my Navy days.

I was thinking on getting rid of one of them and using the funds to have the other refurbished by one of the experts on the web.

Thanks again to all for the replies.
